His vocational history disclosed that, although employed as a handyman just prior to the accident, he had previously been a skilled mechanic. He was placed in this supervised work activity service. Desiring to secure his settlement, he put great effort into his work, and as a result there was marked improvement in his physical and mental condition. His interest was aroused in mechanical work, and he voluntarily gave up the business idea and turned his attention to getting into condition to return to a regular job. Work treatment was quickly followed by regular training in machine-shop practice. This restored his former skill. The settlement was approved and paid with no danger of its foolish use when training was completed. Following quickly the completion of training, he was placed for one month without wage in employment in regular industry to re-establish his productive ability. He was then placed as a maintenance man on the repair and overhauling of business machines at \$25 a week—a wage \$8 more than he was earning on the accident job. Furthermore, he was reinstated in his former work as a machinist. His industrial and social values were restored, and he was fully compensated.

A man, aged 45, during the last six years prior to accident while employed as a taxi driver, had been injured six times. Five of these were head injuries. These repeated accidents were bad business for the insurance carriers. The complications were an antagonistic attitude toward everybody, family on relief, and great financial need. The last carrier had appealed from the referee's decision. The man had become abusive and had been arrested and committed for mental examination and observation. All this did not improve his emotional instability.

His vocational history turned up an early life as a jockey and horse trainer. This had been followed by association with the silent movies. He had been a co-author and actor in the first race-track film entitled, "The Home Stretch." Following this he had been a sales manager,

total vocational loss which, if left unattended, would be permanent.

When confronted with this condition often complicated with emotional interference, it became necessary to experiment in an attempt to restore vocational capacity and return the worker to employment.

The problem was one of improvement in physical function and mental attitude with the elimination of emotional controls. Direction and supervision were necessary. To secure this, supervised physio-vocational therapy or work treatment was initiated under private auspices*. By effectively proving its value, it has ceased to be an experiment and has been the means of salvaging large numbers of these injured workmen after long periods of idleness following accident—workmen who were unemployable or only employable with marked down-grading in earning capacity.

A study was made of 246 exposed to this treatment over a given period of time. The average period of unemployment prior to admittance was twenty-two months. It ran as high as seven years in some instances. The average period of treatment was approximately three months. The results were as follows:

Re-employed	179	(72.7)
Employable waiting placement	29	
<hr/>		
Total employable as a result of the service	208	(84.5)
Discharged from medical service	2	
Discharged as unemployable	36	(14.6)

This was an older group who had to return to work on the basis of existing qualifications, the average age was 43 years.

The purpose of this physio-vocational therapy is to re-establish employability. By providing for attendance every day and for a full day, as medically permissible, the necessity for idleness is removed, and supervised muscular and mental effort is substituted, thus preventing or reducing the disastrous physical and mental consequences of injury. Actual employability can be tested and guess-work eliminated. By promoting maximum voluntary manipulation and use of the disabled part, it completes the work of the doctor and determines the necessary permanent physical limitations. It puts actual relative values on the percentages of physical and vocational incapacity and on the degree to which

both are controlled mentally. It provides the machinery for preventing or eliminating an emotional control known as neurosis. It promotes confidence and restores work habits. By determining the degree of disability interference, it establishes the possibility of return to the former occupation. By discovering abilities for other work and the capacity to profit by training, it establishes the possibility of a profitable change in job status in which residue disablement will not be a handicap.

It provides shop atmosphere and shop environment as necessary to promote the ability to carry on in actual employment. Punctuality and regularity are insisted upon within the prescribed hours for each patient. Practical mechanical and clerical work is used as the medium for activity. It is as varied as the types of work in which these men have engaged. The psychological advantage of using the kind of work in which they have participated is that it provides a maximum of job opportunity testing and restores ability and confidence on work with which they are familiar or which has common labor value. *They work to restore ability in their work on their work, and the transition, therefore, into employment is definite and needs no interpretation.* Also, it makes possible the assignment of work without noticeably attracting the patient's attention to the major purpose.

Ingenuous planning of work is necessary to remove the conscious and subconscious mental restrictions and to release the mind from dwelling upon the disability, thus giving muscular function its greatest opportunity to improve and complaints a chance to be forgotten. The stimulation of an impelling self-interest and desire to cooperate is important.

Facilities are available for job testing in drafting, carpentry, tinsmithing, soldering, radio work, painting, plastering, automobile work, electricity, plumbing, glazing, and sewing machine operating. It is job participation for practical and therapeutic purposes. In this manner pipe-threading is not only practical but an excellent exercise for injured arms, wrists, hands, and backs.

Other types of work include the care of a steam boiler and the duties of porter or janitor. The final test of disability complaint elimination for a coal passer was his moving two tons of coal from the street chute to the coal bin. Thus was he convinced he could return to his former work.

The office offers the usual range of office work tests and includes the packing and the tying-up of bundles and messenger service.

THE POSTCONCUSSION SYNDROME

MORTIMER G. BROWN, M.D., F.A.C.S., Syracuse, New York

DURING the decade beginning about 1920, medical literature abounded in topics based upon the consideration of head injuries and their sequelae. For several years comparatively few articles pertaining to this subject have appeared. Does this mean that the last word in the evaluation of postconcussional trauma has been uttered or that the subject has been temporarily laid aside as hopeless?

To many of us, the question of what evolves when the contents of the skull meet with external violence constitutes a most interesting phase in otology. Research in the interpretation of physiologic and pathologic factors involved has not been exhausted, nor can the controversial consequences relative thereto be relegated to the medical discard.

The appreciation of what constitutes a cranial injury of significance is of paramount import not only with regard to the patient prognostically and industrially but, as many of these cases become medicolegal problems, such injuries have to be understood by those who have the responsibility of administering justice and determining fair monetary settlements. Between the injured and the referee, proper appraisal of certain symptoms by a medical examiner is most important. His knowledge of the subject under debate should be not only an appreciated service in legitimate adjustment but may determine whether a claimant will be restored to a normal self-sustaining member of society or consigned to a life of neurotic invalidism. On the other hand, proper examination should apprehend the malingerer and relieve society from the perpetual maintenance that too often results from miscarried verdicts due sometimes to a sympathetic understanding on the part of an administrator of justice and, more often perhaps, to an unsympathetic misunderstanding on the part of the medical examiner. Yet, if we are unable to create a standard by which a proper determination can be made, we must not be too critical in our condemnation. Our pity should go to the referee, who in an honest attempt to arrive at an equitable solution is confronted with a galaxy of conflicting expert opinions that convinces him that none of us knows whereof we speak.

In this paper it is not my intention to settle

Read at the Annual Meeting of the Medical Society of the State of New York, New York City, May 8, 1940.

the question of a perfect evaluation but rather to agitate a desire among those who are interested in this type of neuro-otology for the establishment of some concrete rule as to what constitutes acoustic and vestibular disability, to correlate certain experimental and accepted facts, and to crystallize these findings in a simple manner that can be understood by the "occasional" otologic witness, the average medical examiner, and the referee in compensation cases.

Just what is meant by "brain concussion?" In the present state of general misconception the scope of the term seems to apply to any cerebral condition, from the mere "shaking up" of the skull contents to brain damage consisting of contusion, laceration, or hemorrhage. Whether an injured person has or has had concussion too often depends upon the personal opinion of the physician who made the first examination, possibly sometime after the accident, upon the statement of individuals who may have been witnesses to the mishap, or upon certain signs and symptoms obtained from the patient himself. Unfortunately, such an incomplete picture of the actual happenings cannot be helped. For the patient who is seen quite soon after the accident by an alert ambulance surgeon and is observed by the well-trained personnel of a traumatic receiving ward the working diagnosis is more helpful, but even here there is much to be desired.

The definition of brain concussion as a "sudden inhibition of brain-cell function, the result of external violence to the skull and characterized by a transitory loss of consciousness" is not sufficiently specific. Loss of consciousness in head injuries may embody any degree of mental confusion from mere giddiness to a complete suspension of cerebral faculties over a period of time.

It is at this point that the otologist may encounter the first controversial factor, for, if unconsciousness is accepted as a cardinal sign or symptom of brain concussion, it may be averred that without loss of consciousness there has been no brain concussion. Hence, our claim that labyrinthine imbalance is a relevant postconcussional sequela may be refuted. Yet, we find many cases with later vestibular symptoms but no unconsciousness, as it is generally interpreted.

during prohibition for a hair tonic concern, which concern dealt in alcohol. The environmental pattern and personality characteristics were thus established. Then when the bottom fell out of the prohibition liquor trade he turned to taxi driving as a means of keeping in contact with the representatives of his former environment. He only worked the better clubs, bars, and restaurants. He was seeking to compensate himself by maintaining contact with the environmental pattern that controlled his life. Unfortunately, he selected a work for which he was not adapted, although it appeared he had used his head continually but not wisely.

These repeated accidents interfering as they did with his desired association were responsible for his violent and abusive attitude. He was frustrated and he rebelled. The solution of his problem was in finding him work that would again bring him into the association and environment he desired, remove the hazard, and be something he could do. This was accomplished by training in bartending. As a bartender he is fully compensated. Even at the initiation of this training there was an immediate improvement in his mental attitude, and the carriers heaved a great sigh of relief at knowing that he was not going to return to taxi driving.

Last, a man had been awarded a scheduled loss of 100 per cent of the right hand. He had a badly damaged hand, but the total disability award had been compelled by hysteria control. He had been out of work for thirteen months and was completely discouraged. Lack of funds had broken up his home. His wife had taken their children and gone to live with friends. Debts had accumulated. He was Italian born, a manual worker with practically no education, and 37 years of age. With only one hand to use, the left one and adapted to only manual work, he was unemployable except as a watchman and then only by a sympathetic employer.

Work treatment was instituted to improve his mental attitude, restore maximum function to the disabled hand, and determine his maximum actual physical and mental work possibilities. To assist in this restoration of a more hopeful attitude and relieve his worry, an advance

of compensation was secured to pay off debts and to re-establish the family in its own home. His gratitude stimulated cooperation, and he showed increased interest and made greater effort. This improvement in his mental condition was accompanied by marked improvement in his hand. Here, no vocational training was necessary. The successful results of the work treatment re-established his employability and returned him to his previous work. He was fortunate in securing a job at a wage of \$15 more than his pre-accident wage. Despite the medical decision of permanent loss of use at the time the claim was settled, this man writes: "The company is unaware of my hand being disabled. I find that I can do the work competently and can use my hand very well."

Relationship, Medical and Vocational Restoration

I have tried to point out, and I hope I have succeeded, that the service now rendered is constructive in accomplishment but that it indicates greater possibilities resulting from the adoption of this program of physical and vocational restoration administered with intelligent appreciation of its objective and full interrelated cooperation.

1 A better knowledge of the patient's job qualifications and physical job performance requirements.

2 Consultation between job analyst and physical analyst, with consideration of maximum physical job performance ability.

3 Physio-vocational therapy to prevent and control emotional interference and other damaging influences, to hasten recovery and complete the work of the doctor, and to secure maximum physical and vocational possibilities.

4 To return to former work and former environment when possible. To retrain when necessary and feasible.

5 To accomplish re-employment with the least amount of loss of time and vocational capacity.

THE ANATOMICAL EXTRAS

Egad, egad, and a loud forsooth!
Tonsils, appendix and wisdom tooth!
Nary a one is dutiful
To the body beautiful,
(For all of that, I might say smugly
The same is true of the body ugly.)
None performs a task or service,
Unless it is to make us nervous;
They're standard equipment for every one
Pater, mater, daughter, son,
Uncle, nephew, niece, and aunt,
Abraham Lincoln, U. S. Grant,

Rockefeller, Ford and Bendix—
Each had tonsils and appendix
Spinster, widow, beau and belle,
All have wisdom teeth as well.
The guests unwelcome, the guests uncouth—
Appendix, tonsils and wisdom tooth
Scientists, with deep chagrin,
Wonder why God put them in,
But smiling clerics say Jehovah
Had a little sand left over

the question of a perfect evaluation but rather to agitate a desire among those who are interested in this type of neuro-otology for the establishment of some concrete rule as to what constitutes acoustic and vestibular disability, to correlate certain experimental and accepted facts, and to crystallize these findings in a simple manner that can be understood by the "occasional" otologic witness, the average medical examiner, and the referee in compensation cases.

Just what is meant by "brain concussion?" In the present state of general misconception the scope of the term seems to apply to any cerebral condition, from the mere "shaking up" of the skull contents to brain damage consisting of contusion, laceration, or hemorrhage. Whether an injured person has or has had concussion too often depends upon the personal opinion of the physician who made the first examination, possibly sometime after the accident, upon the statement of individuals who may have been witnesses to the mishap, or upon certain signs and symptoms obtained from the patient himself. Unfortunately, such an incomplete picture of the actual happenings cannot be helped. For the patient who is seen quite soon after the accident by an alert ambulance surgeon and is observed by the well-trained personnel of a traumatic receiving ward the working diagnosis is more helpful, but even here there is much to be desired.

The definition of brain concussion as a "sudden inhibition of brain-cell function, the result of external violence to the skull and characterized by a transitory loss of consciousness" is not sufficiently specific. Loss of consciousness in head injuries may embody any degree of mental confusion from mere giddiness to a complete suspension of cerebral faculties over a period of time.

It is at this point that the otologist may encounter the first controversial factor, for, if unconsciousness is accepted as a cardinal sign or symptom of brain concussion, it may be averred that without loss of consciousness there has been no brain concussion. Hence, our claim that labyrinthine imbalance is a relevant postconcussional sequela may be refuted. Yet, we find many cases with later vestibular symptoms but no unconsciousness, as it is generally interpreted.

Accepting the fact that in pure or simple concussion—there being no cell death—complete recovery without sequelae should ensue, it is difficult for the industrial surgeon or referee to comprehend how and why there can be vestibular irritation over a long period of time. It is even more difficult for him to acknowledge the presence of incapacitating dizziness if the diagnosis of brain concussion has not been established, because in his records there has been no mention of loss of consciousness.

To us, the theory of brain compression with cerebrospinal damage to the vestibular nuclei or vasomotor changes with persistent prestatic changes in the blood circulation sufficient to produce vestibular hyperirritability and justify the diagnosis of recurrent attacks of vertigo seems entirely rational, but it is next to impossible to prove our point if the presence of brain concussion was denied because there was no evident loss of consciousness. Brain concussion as a clinical symptom and concussion of the brain as a pathologic condition cannot have the same meaning.

Therefore, it would seem that the general conception of the term "brain concussion" should be amended. An intermediate classification of "cerebral commotion with vestibular involvement" might clarify the situation.

It is my own opinion that if simple concussion is severe enough to produce retrograde amnesia, even without actual manifest loss of consciousness, it is sufficient to cause labyrinthine concussion with a persistent vestibular hyperirritability as the only aftermath of injury.

In arriving at the end results of traumatism to the head, the relative unimportance of basal fracture as a cause of postconcussional symptoms must again and again be emphasized. Even at the present time the diagnosis of labyrinthine vertigo often brings forth the prompt statement from the industrial surgeon that the otologist must be in error because there was no evidence of fracture demonstrable by x-ray or clinical findings. The fact that inner-ear concussion is more likely to occur without fracture of the base is well established. Fracture of the skull and cerebral concussion with vestibular involvement are entirely separate entities and must be considered as such.

While the skull fracture involving the base may seem of greater interest to the otologist because of the middle-ear complications, injuries to the vault and facial bones must not be ignored, concussion with ear symptoms or

even severe labyrinthine concussion may follow fracture of any of the head bones.

The classification of basal fractures as longitudinal, transverse, and rupture of the petrous tip seems adequate.

According to Brunner,¹ the longitudinal fracture starts in the tegmen of the antrum and goes forward into the roof of the eustachian tube, constituting the typical middle-ear fracture, the fracture may extend into the superior wall of the external meatus, the tympanic membrane is usually lacerated, the tympanum is partially or completely filled with blood. The middle-ear muscles, especially the tensor tympani, are frequently destroyed, the ossicular chain is ordinarily intact, but in a minority of cases the incus is dislocated.

Diagnosis of longitudinal fracture is made by (a) otoscopic examination, (b) x-ray (if positive, proves fracture and, if negative, proves nothing), (c) the tympanic picture—is often that of a bluish black drumhead (hematotympanum), (d) bleeding from the external canal—does not prove the presence of fracture of the base—an outflow of cerebrospinal fluid is a positive indication, and (e) functional tests—show diminution of hearing (30 per cent) and slight labyrinthine symptoms.

Prognosis as to function is not good because the hearing loss may be progressive due to adhesions. As to life, the mortality ratio is about 1 out of 15 from meningitis, there is always a question, as meningitis may develop with subsequent middle-ear infections because of the fibrous repair of these fractures.

The transverse fracture starts in the region of the jugular bulb, crosses the pyramid, and ends in the anterior surface of the pyramid. The typical findings are a shattering of the roof of the vestibulum, cochlea, and semicircular canals, which are usually destroyed by hemorrhage. It is of great importance, prognostically, whether or not the lateral wall is fractured, because if fractured there is a direct pathway from the pharynx to the meninges. If the lateral wall is not fractured, prognosis is better.

Diagnosis of transverse fracture is made by (a) x-ray—is more reliable than in longitudinal fracture because the fissure is more open, (b) otoscopic picture—usually shows a normal drumhead, and (c) functional tests—show marked or complete deafness together with loss of vestibular responses.

Prognosis as to function is hopeless because the deafness is permanent. As to life, the outcome is doubtful, meningitis occurs in about 1 out of 6 cases.

Importance of Early and Frequent Ear Examinations

There can be no doubt as to the value of early otoscopic examination in all cases of head trauma, no matter how inconsequential

the injury may seem to have been. Yet, with the possible exception of service cases that are observed by a competent traumatic personnel or the occasional private patient whose attending surgeon appreciates the worth of an otoneurologic study, we are rarely permitted this privilege. This unfortunate situation is particularly true in compensation cases that too often fall into an intermediate class and, therefore, do not have the advantage of the careful observation accorded those in the other two groups. It is usually these poorly studied cases that present the most difficult problem in arriving at the proper evaluation of postconcussional symptoms.

While we all deplore unnecessary and meddlesome manipulation within the ear canal in frank basal fractures, the determination of the source of bleeding has sufficient diagnostic, prognostic, and in some cases therapeutic significance to justify an initial inspection. The presence of blood may be extraneous, coming from laceration of nearby structures, or it may arise from an abrasion within the canal. If a definite bleeding fissure of the tympanic ring or membrane is visualized, the examination may be the determining factor in the diagnosis of skull fracture, thus, perhaps, sparing the patient an immediate "emergency" radiography. Also this early examination may help to determine whether hemorrhage is coming from a ruptured tympanic membrane due to extravasated blood in the tympanum or fracture involving the tympanic ring. Obviously, strict aseptic technic must be employed. If bleeding continues upon gentle sponging of the canal, it undoubtedly arises from fracture of the meatal wall, tympanic ring, or middle ear. If so, fracture of the base may be assumed and further examination is neither necessary nor desirable. The precise location of tympanic laceration is not required—better to be content with a diagnosis of tympanic bleeding, apply a loose sterile dressing, and avoid further inspections, unless symptoms warrant the procedure. The possible urge to control bleeding by tamponage or free the canal of accumulated blood by irrigations is to be condemned, free hemorrhage from the middle ear may be of real value in relieving intracranial pressure, irrigations can convey infection to a sterile field.

The immediate diagnosis of escaping cerebrospinal fluid is not always easy. If there is an admixture with blood—and this is the rule at early examination—the blood may appear "thin" or possibly more profuse than might

ordinarily be expected. Later, excoriation of the meatal derm may confirm the suspicion. Outpouring of clear fluid is definite evidence.

Early otoscopic inspection, furthermore, may determine the presence of a blood-filled tympanic cavity, the knowledge of which may be helpful in explaining future middle-ear symptoms. Whether or not evacuation of this accumulated blood be necessary is debatable, depending, perhaps, upon symptoms of intratympanic pressure.

Nystagmus may also be noted and will prove a valuable asset in the later-day evaluation of labyrinthine symptoms, as well as the immediate diagnosis of severe inner-ear damage.

All of this information can be obtained even during a period of unconsciousness.

If the patient is conscious and mentally clear, complaints of vertigo or hearing impairment may constitute pertinent data in the final determination of disability. Differential diagnosis between conductive and perceptive hearing loss can thus be made early, establishing or eliminating extensive inner-ear involvement.

In this way the otologist derives first-hand information not only in confirmatory diagnosis but in the interpretation of postconcussional symptoms—a fact entirely overlooked in most cases.

With but few exceptions it must not be expected that a single otologic examination, either early or later in the course of the case, will be sufficient for a proper evaluation of the postconcussion syndrome. Repeated functional tests and careful observations have to be made from time to time in order to establish the extent of damage to the ear structures and determine the presence or absence of traumatic neuroses. This is even more important in the apparently trivial injuries where a certain amount of labyrinthine concussion has taken place than in those cases giving positive signs of more definite pathologic changes.

In these "minor" traumas, recurrent attacks of dizziness, sufficient in some occupations to make work hazardous or altogether impossible, is oftentimes the outstanding complaint. To substantiate the diagnosis of labyrinthine hyperirritability, frequent examinations are absolutely necessary, as nystagmus and positive head-movement tests are not constant but may be demonstrated on occasions.

It must also be remembered that in concussion of the inner ear hemorrhage is invariably coexistent and that in the reparative processes hearing loss may be progressive,

atrophic changes involving the end-organs is a common later-day finding. In middle-ear conditions, either with or without petrosal fracture, repeated examinations are required because hearing function is quite likely to change, particularly in the young individual where gradual improvement in hearing acuity may be anticipated.

In order to arrive at a proper evaluation of postconcussional symptoms, it must be understood that these cases require intensive and, usually, prolonged study. The otologist who has not the time or inclination to devote sufficient time for a thorough consideration of the many phases pertaining to the subject should not undertake the responsibility of submitting an opinion, for a superficial examination and "snap" diagnosis add to the confusing statements so often presented before a court of justice. Independent neurologic and otologic histories and examinations are necessary, coordination of these individual findings will establish a composite picture representative of the actual condition present and leave but little room for doubt and conjecture.

The case history must be complete, specific, and accurate, based upon a careful description of the accident, the nature of injuries incurred, and all subsequent developments.

Otologically, the personal history should take into consideration the age, familial tendencies (including deafness), diseases of childhood (particularly mumps, scarlet fever, measles, and encephalitis), middle-ear infections, possible hearing embarrassment during the school age, diseases of the central nervous system, syphilis, and all illnesses having neurologic aspects. Any former injury to the head or ears, previous and present occupation, the general health, nervous stability, and character status constitute important data.

Before the patient is questioned he must be made to understand that cooperation and truthfulness are necessary if he is to be helped. An attitude of utter fairness on the part of the examining physician will gain more in the way of a comprehensive history than one of commiseration or sneering mistrust in the statements presented. The examinee should be permitted to tell his own story and describe his complaints, for in this way, unless he is unusually clever or has been well "coached," the experienced examiner can readily detect gross exaggeration or malingering. Direct reference to the common complaints of headache, deafness, inability to work or concentrate

must be avoided, indirect questions that will draw out relevant symptoms pertaining to the head and ears should be employed.

As to the injury, a detailed description of what transpired just prior and immediately following the injury should be sought from the patient and verified by authentic records, wherever possible, in order to establish the existence of unconsciousness, its intensity and duration. Even in the presence of a fair recollection of events subsequent to the accident, retrograde amnesia may be considered definite proof of brain concussion sufficient to produce later ear symptoms.

With a complaint of hearing loss it is important to have the patient's idea as to the time of onset and its degree and whether it is unilateral or bilateral, constant or intermittent, stationary or progressive. In some instances changes in the normal tonal range may be elicited. Obviously, a claim of total deafness in one or both ears must be looked upon with suspicion. Careful and repeated tuning fork tests, audiometric readings, conversation appreciation, and sometimes off-hand remarks will determine hearing ability of reasonable accuracy.

Among the more or less accepted facts relative to postconcussional deafness, the following may be emphasized.

Total bilateral deafness has never been verified.

Total unilateral deafness is rarely observed, is usually due to a transverse fracture destroying the labyrinth or acoustic nerve, and is permanent.

Loss in hearing due to labyrinthine concussion is not primarily complete, although the residual hearing ability may be of no value for ordinary conversation, but the loss may be progressive due to subsequent atrophic changes in the acoustic structures.

Hearing loss of middle-ear type, the result of a longitudinal fracture or intratympanic hemorrhage, is likely to improve in young persons but should not be anticipated in individuals past 40 years of age.

If the intratympanic structures have been severely damaged or the incus dislocated, hearing loss will be permanent, in some cases it may be progressive due to acute or recurring inflammations.

If there was an outpouring of cerebrospinal fluid, total deafness in the ear involved may be expected in about one-fourth of the cases, the upper tone limit is usually lowered, but bone conduction is little changed.

Normal vestibular responses may be ob-

TABLE 60 (QUOTED FROM KESSLER¹)

Each Ear	No Hearing with Loss of Bone Con- duction, Percentage	No Hearing with Bone Conduction, Percentage	1/40, Percentage	5/40, Percentage	10/40, Percentage	20/40, Percentage
No hearing with loss of bone conduction	40	30	30	25	20	10
No hearing with bone conduction	35	30	25	20	15	10
Spoken voice						
1/40	30	25	20	15	12	7
5/40	25	20	15	12	8	5
10/40	20	15	12	10	7	5
20/40	10	10	7	5	5	0

tained even in the presence of total acoustic loss. Tinnitus and hearing loss is dependent upon the severity of the injury.

Several attempts have been made by interested investigators to prepare a schedule to fix a percentage hearing loss that would take into consideration the individual's occupation or working ability. This has proved to be a difficult task. Probably coming nearer to the point in question is the work of Dr. Harold E. Fletcher, of San Francisco,² who in 1922 proposed the use of a "weight" scheme in computing hearing disability. This "weight," numerically expressed, represented the importance of hearing perception in various occupations and became an integrant unit in the summation of hearing time for the different tuning forks. This plan of rating was found to be workable and was adopted by the California State Commission. It was used in California for fifteen years. While this scheme has been recently replaced by audiometric deductions, its soundness in principle and its carefully determined valuation of occupational hearing requirements would seem to favor its further consideration.

In a book called *Accidental Injuries* by H. H. Kessler,³ there is a general consideration of the appraisal of disability resulting from loss of hearing as follows: "The lowest schedule rating for the loss of hearing in one ear is twenty-five weeks in Kansas, and for the loss of hearing in both ears, one hundred weeks, so that loss of hearing in one ear is given a rating equivalent to 25 per cent of total loss of hearing. The schedule rating runs as high as 156 weeks for the loss of hearing in one ear in Oregon, to 416 weeks for the loss of hearing in both ears. In general, loss of hearing in one ear is given a rating from 20 to 30 per cent of the total loss of hearing. It would seem that the ratings in Oregon are altogether too high for hearing losses as compared to disabilities in other parts of the body.

"Loss of hearing either in one or both ears following injuries to the head or shaking up of the whole body in a fall from a height has been uncommon in my experience. In a small number of cases that are alleged to have occurred as a result of trauma, the majority have shown either a functional condition or the presence of an old middle-ear disease. Even in the presence of vertigo following head injuries a complaint of deafness has rarely been made.

"For the purpose of rating disabilities due to defects in hearing, 20/40 (hearing of a conversational voice at 20 feet, with one ear closed and the back toward the examiner) in either ear should be regarded as the maximum of normal hearing, and the total loss of bone conduction of sound should be considered as total deafness.

"In the presence of a functional condition in one ear, the rating should not be as high as for neurosis in general but should be equivalent to one-half the rating for organic loss of hearing in one ear. In the presence of functional total deafness, the disability should be equivalent to that allowed for neurosis in general.

"For total loss of hearing, the schedule of most states allows on the average of about 40 per cent total permanent disability. With this as a basis, Table 60 is suggested for defects of organic origin."

The subject is discussed by A. J. Fraser in his *Trauma, Disease, Compensation. A Handbook of Their Medico-Legal Relations*.⁴ In Chapter XII Fraser discusses the rating of permanent disability and furnishes a copy of the rating schedule in use by the majority of industrial boards in Canada. The percentages stated are apparently the percentages of loss of total earning capacity. According to this schedule, the loss of hearing in both ears is equivalent to a loss of 30 per cent of earning capacity, and the loss of hearing in one ear is equivalent to the loss of 3 per cent of earning capacity. The loss of earning capacity for deafness is further analyzed as follows:

- "1 Unilateral without tinnitus or vertigo 3%
- 2 Unilateral with tinnitus or vertigo 5 to 10%
- 3 Unilateral impairment of hearing Nil
- 4 Bilateral deafness (total) 30%
- 5 Total, one ear, other much impaired 10 to 25%"

Neither Kessler's nor Fraser's figures take into consideration the nature of the occupation of the incapacitated employee. Obviously, the impairment of hearing of a stenographer or switchboard operator would result in a much greater percentage of disability than it would in the case of a person employed in an occupation not requiring such acute hearing.

I have been informed that the Council on Physical Therapy of the American Medical

Association, through its consultants on hearing aids and audiometers, is at the present time studying the practicability of formulating a standardized test for evaluating hearing loss. It is impossible to overstress this need.

The change made in the New York State Compensation Law,* which now considers the ear as a body "member" and thus allows compensation for the permanent partial hearing loss in one ear, is a notable improvement in the original schedule, the fallacy in the amendment may prove to be failure on the part of the examiner to appreciate pre-existing ear conditions with resultant impairment in hearing.

The subjective symptoms of headache and tinnitus are of interest to the otologist only when they appear as complaints in conjunction with demonstrable ear pathology. As a part of the postconcussion syndrome, headache of variable degree is usual, whether or not it becomes an outstanding complication should depend upon the type and severity of the injury received.

While the headaches appearing in paroxysms upon change in position of the head or on exertion are said to be characteristic, particularly if the attacks are in association with dizziness, a more-or-less constant headache may actually exist if there has been brain-substance damage. Hence, headache as an otologic symptom seems indefinite, and its compensatory evaluation is essentially a problem for the neurologist.

Evaluation of Vertigo

Vertigo, of more or less degree, is probably the most common, persistent, and troublesome of the postconcussional symptoms. To the average otologist and neurologist its precise evaluation is impossible. Even with the most experienced investigators there are differences in interpretations that complicate a clear understanding. It is certain that various vestibular responses so important in otoneurologic examinations for the diagnosis or localization of central lesions are not applicable to traumatic disease where the damage may be central, peripheral, or a combination of the two.

In history-taking, the patient's description of what may be interpreted as dizziness is often a jumble of sensations, and while we may aim to draw out the rotatory characteristics of true labyrinthine vertigo, failure to do so does not mean that the lack of this classic quality indicates a functional neurotic element. The presence of rotatory vertigo

clinches the diagnosis, its absence proves nothing.

Vertigo observed early where one labyrinth has been severely damaged by fracture or hemorrhage is quite different from that found later as a postconcussional symptom, for even in the more severe types of injury pronounced immediate vertigo often disappears within a few days due to resolution within the labyrinthine structure or, in the case of total destruction, by compensatory function of the opposite organ. Therefore, it is usually the apparently trivial head injury accompanied by moderate pathologic changes, either central or peripheral, that requires the closest study if these cases are to be separated from those of traumatic neurosis.

Much of the credit for a better appreciation of traumatic vertigo must go to Stenger, Alexander, Brunner, and others of the Viennese school, who by their experimental work and careful observations have accomplished a great deal, even though their findings are not always in harmony. The exactness by which they apply and interpret the several functional tests necessary for a diagnosis is an outstanding contribution to our present-day understanding of head traumas.

It is not within the scope of this paper to review the significance of nystagmus, past-pointing or functional tests, there should be no question as to their worth, providing the technic and interpretation is correct. In the final analysis, assuming that diseases that can give similar or allied symptoms have been eliminated as producing factors, for all practical purposes if the patient can substantiate his claim of dizziness coming on in attacks and if imbalance due to hypo- or hyperirritability can be demonstrated by caloric reactions, then vertigo as a postconcussional symptom must be accepted as a fact. And again let it be emphasized that dizziness is often a later-day complaint, coming on when the injured first returns to work, upon stooping or when working at heights, when fatigued or following alcoholic excesses.

However, it has to be admitted that many of these cases do present a definite neurologic element. A certain amount of exaggeration of complaints has to be expected, and hysterical manifestations need to be taken into account. Malingers are frequently encountered, and certain responses, like past-pointing and the falling reactions, can be faked, but to simulate spontaneous nystagmus or control induced nystagmus would certainly be an abnormality.

The criticism by the neurologist that the otologist often goes too far in his interpretation of reactions and is overanxious to exploit what little knowledge he may have on the subject has some justification, but no neurologic examination should be considered complete without careful otologic investigation, and, if this study shows positive evidence of disturbance along the vestibular pathways, our findings may be of the greatest value to the neurologist in differentiating between the functional and organic cases. Individual examinations and a correlated opinion seems to be the best solution in the average case.

The presence of true or systematized dizziness having been established, the question of disability becomes a real problem. Assuredly, vertigo, even though of intermittent character, is a much greater handicap than deafness of any degree, for it is a menace to both life and health. Industrially, it constitutes a working hazard that if known to a prospective employer will permanently bar a person from any employment where personal or working risks have to be considered. Therefore, the opinion of the neuro-otologist, based upon his determination of the extent of vestibular damage and potential progress of the condition, becomes the most important factor in diagnosis and prognosis and furnishes the only adequate means by which the case may be properly classified. His responsibility in determining whether the injured should be compensated to the extent of total permanent disability or dismissed as a case of functional neurosis is indeed great.

It is important psychologically that the injured individual be rehabilitated at the earliest possible date, wherever possible, monetary settlement should be made as soon as is consistent with an accurate diagnosis, and the case should be closed beyond the possibility of being reopened. However, the apparent improvement of symptoms following satisfactory compensation does not prove the correctness of the diagnosis of "traumatic neurosis", many times the otologist has the opportunity of re-examining these cases years afterward, and more and more he is impressed that the postconcussion syndrome is a real disease entity.

While from the standpoint of compensation the perfect solution is quite impossible, a recognized standard whereby a percentage loss might be reached would constitute a valued and much needed addition to the schedule by which our Industrial Board renders its decisions.

In analyzing their series of 30 cases, Lanthicum and Rand⁶ conclude "This series of concussion cases, when viewed purely from neuro-otological evidence, would seem to indicate an actual basis for symptoms of dizziness, since, in no instance, have entirely normal vestibular responses been demonstrated, and in the majority of cases the deviation from the normal was sufficiently large to class them as being distinctly pathologic."

Concussion of the brain, with ear symptoms exclusive of concussion of the inner ear and fracture, is diagnosed by Brunner¹ as follows:

"(a) The cochlea shows normal function, there is no shortened bone conduction.

"(b) Dizziness, as a rule, comes on in paroxysmal attacks, it is not continuous and is usually tactile in character.

"(c) Spontaneous nystagmus is slight and goes to both sides, if intensive, it is due to hemorrhage.

"(d) Disturbances in the falling reaction are either not present or slight.

"(e) The head-movements test is not constant, but from time to time is positive.

"(f) Caloric reaction is normal or shows hyperirritability."

Diagnosis is determined by positive head-movements test, by hyperirritability, or both together, if positive, patient has dizziness.

The prognosis is not good because dizziness persists indefinitely. Compensation should be based upon from 50 to 70 per cent disability.

Discussion

Dr Charles J Imperatori, New York City—The group of symptoms that occur many times following a concussion of the brain is a most interesting one, and Dr Brown is to be congratulated in presenting this paper for discussion.

The possible anatomic or chemical changes that occur following such an injury to the brain structure with disturbance in its normal function produce a train of clinical manifestations, such as headache, vertigo, degrees of loss of hearing, and tinnitus, that belong for interpretation and treatment within the domain of otology. It is to the otologist, during some time of the manifestation of these clinical abnormalities, that the patient is sent. He is asked, and particularly if the patient injured is one coming under monetary compensation, to evaluate the degree of disability, state the prognosis, and define a course of treatment to induce a recovery to normal.

Association, through its consultants on hearing aids and audiometers, is at the present time studying the practicability of formulating a standardized test for evaluating hearing loss. It is impossible to overstress this need.

The change made in the New York State Compensation Law,⁵ which now considers the ear as a body "member" and thus allows compensation for the permanent partial hearing loss in one ear, is a notable improvement in the original schedule, the fallacy in the amendment may prove to be failure on the part of the examiner to appreciate pre-existing ear conditions with resultant impairment in hearing.

The subjective symptoms of headache and tinnitus are of interest to the otologist only when they appear as complaints in conjunction with demonstrable ear pathology. As a part of the postconcussion syndrome, headache of variable degree is usual, whether or not it becomes an outstanding complication should depend upon the type and severity of the injury received.

While the headaches appearing in paroxysms upon change in position of the head or on exertion are said to be characteristic, particularly if the attacks are in association with dizziness, a more-or-less constant headache may actually exist if there has been brain-substance damage. Hence, headache as an otologic symptom seems indefinite, and its compensatory evaluation is essentially a problem for the neurologist.

Evaluation of Vertigo

Vertigo, of more or less degree, is probably the most common, persistent, and troublesome of the postconcussional symptoms. To the average otologist and neurologist its precise evaluation is impossible. Even with the most experienced investigators there are differences in interpretations that complicate a clear understanding. It is certain that various vestibular responses so important in otoneurologic examinations for the diagnosis or localization of central lesions are not applicable to traumatic disease where the damage may be central, peripheral, or a combination of the two.

In history-taking, the patient's description of what may be interpreted as dizziness is often a jumble of sensations, and while we may aim to draw out the rotatory characteristic of true labyrinthine vertigo, failure to do so does not mean that the lack of this classic quality indicates a functional neurotic element. The presence of rotatory vertigo

clinches the diagnosis, its absence proves nothing.

Vertigo observed early where one labyrinth has been severely damaged by fracture or hemorrhage is quite different from that found later as a postconcussional symptom, for even in the more severe types of injury pronounced immediate vertigo often disappears within a few days due to resolution within the labyrinthine structure or, in the case of total destruction, by compensatory function of the opposite organ. Therefore, it is usually the apparently trivial head injury accompanied by moderate pathologic changes, either central or peripheral, that requires the closest study if these cases are to be separated from those of traumatic neurosis.

Much of the credit for a better appreciation of traumatic vertigo must go to Stenger, Alexander, Brunner, and others of the Viennese school, who by their experimental work and careful observations have accomplished a great deal, even though their findings are not always in harmony. The exactness by which they apply and interpret the several functional tests necessary for a diagnosis is an outstanding contribution to our present-day understanding of head traumas.

It is not within the scope of this paper to review the significance of nystagmus, past-pointing or functional tests, there should be no question as to their worth, providing the technic and interpretation is correct. In the final analysis, assuming that diseases that can give similar or allied symptoms have been eliminated as producing factors, for all practical purposes if the patient can substantiate his claim of dizziness coming on in attacks and if imbalance due to hypo- or hyperirritability can be demonstrated by caloric reactions, then vertigo as a postconcussional symptom must be accepted as a fact. And again let it be emphasized that dizziness is often a later-day complaint, coming on when the injured first returns to work, upon stooping or when working at heights, when fatigued or following alcoholic excesses.

However, it has to be admitted that many of these cases do present a definite neurologic element. A certain amount of exaggeration of complaints has to be expected, and hysterical manifestations need to be taken into account. Malingerers are frequently encountered, and certain responses, like past-pointing and the falling reactions, can be faked, but to simulate spontaneous nystagmus or control induced nystagmus would certainly be an abnormality.

the ossicular chain, or injury to the temporomandibular joint is not always demonstrable. Traumatic tinnitus, in my experience, is always subjective and can neither be proved nor disproved.

Next, let us analyze the vestibular symptoms. Nystagmus is objective and usually significant of real pathology. I have had 1 case, however, where the question of malingering had to be considered. Vertigo and dizziness are usually confused in the minds of the otologists. This prompted me to write Dr Isaac Jones, of Los Angeles, an authority on this subject, and to receive this reply:

"Vertigo means turning—a sense of things turning inside one's head—vertigo is limited to a sensation of turning. Gene Lewis, at the beginning of this century gave the most perfect definition. 'Vertigo is a sensation of turning contrary to fact.' Dizziness is a loose term to cover all curious sensations other than true vertigo—dor-

ens of sensations of insecurity, fear of looking out of windows in high buildings, uncertainty, instability, etc."

To summarize there remain just two objective symptoms—namely, deafness and nystagmus, neither of which is sufficient to establish either a definite pathologic lesion or a causal relationship.

We must remember that Ménière's symptom complex presents all the postconcussion syndrome symptoms without injury and with symptoms that are equally as distressing.

It is quite definite from Dr Brown's definitions and deductions that brain concussion or other head injuries are not necessary to the production of this syndrome. Nevertheless, something—mechanical, circulatory, or otherwise—causes a dysfunction of the internal ear. These symptoms often are permanent and distressing, are difficult to appraise and compensate properly, and present a field for further investigation.

DIRECTORY OF MEDICAL SPECIALISTS

1942 Edition

SPECIALISTS eligible for listing in the forthcoming second edition of the Directory of Medical Specialists are urged to fill in and return promptly the questionnaires for biographic data now being mailed out by the publication office.

This Directory is the official publication of the Advisory Board for Medical Specialties, issued every two years, and listings are limited to those formally certified by any of the fifteen American Boards examining in the medical specialties. There is no charge for such listings.

The second edition is now being prepared, and will be ready for distribution early in February, 1942, with biographic, geographic, and alphabetic listings of all diplomates certified to January 1, 1942. It will include approximately 18,000 names.

The Directing Editor is Paul Titus, M.D., 1015 Highland Building, Pittsburgh, Pennsylvania, and the secretaries of the fifteen American Boards constitute the Editorial Board.

SPOILS SYSTEM AND PUBLIC HEALTH

"The argument over government socialized medicine necessarily produces considerable confusion in the public mind," observes the *Saranac Lake Enterprise*.

"The medical profession is not, as some seem to believe, stubbornly opposed to efforts of government to aid the sick and diseased. It heartily approves of such efforts when legitimate and sound.

"It supports government hospitals where private facilities are lacking—supports government medical aid of those afflicted with mental and nervous diseases—supports the long established, excellent work done by the public health service.

"Since 1874, surprising as it may seem, the American Medical Association has repeatedly urged the establishment of a Federal department of health with a secretary who shall be a doctor of medicine and a member of the President's cabinet. It has invariably offered wholehearted cooperation in developing efficient

and economical ways and means of expanding public health and maternal and child health services.

"What, then, does the medical profession—along with qualified laymen—oppose?

"It opposes political ventures in the medical field which would inevitably and rapidly reduce public health standards—and destroy or hamper essential work in the battle against disease.

"Political domination of the medical profession would mean that the doctor's political pull was more important than his abilities as a practitioner. It would mean that medicine would become a great new field for political patronage. Thus, it would mean unnecessary death, unnecessary suffering, unnecessary illness.

"A doctor's party label has no influence on his expertness at diagnosis and prognosis.

"But, under socialized medicine, the party label would come first. The 'spoils system' would invade the public health."

Every one of the above desiderata are difficult to answer so that a proper evaluation may be given from the standpoint of the patient, the employer, and the physician.

Brook, of New York, has defined concussion as a transient loss or defect in consciousness without known pathology from which the individual makes a rapid recovery.

Trotter describes concussion as "an essentially transient state due to head injury which is of instantaneous onset, manifests widespread symptoms of a purely paralytic kind, does not as such comprise an evidence of structural cerebral injury, and is always followed by amnesia for the actual moment of the accident." I rather doubt part of this definition especially "no evidence of structural injury." Inasmuch as concussion is rarely fatal, necropsy material is not abundant for proper study.

Osnato, Gilberti, Cassasa, Wilson, Mickelman, Miller, Martland, and others have found minute petechial hemorrhages about the arterioles in the brain following *more severe brain injuries or after repeated concussions*.

Rather on the speculative side, may I make the following observations.

Much study is required in the chemical changes and metabolism of the brain. Water metabolism and brain function need investigation. We know that substances of a fatty nature, termed lipides, are present in relatively large quantities in the brain. We know that the brain does not store carbohydrates, and we also know, and have known for a long time, that vitamin deficiency causes brain-tissue changes. After much work the glycogen content of the brain is diminished 20 per cent, whereas in other tissues, such as muscle and liver, loss is 90 per cent. There have been found over twenty different enzymes in brain tissue. Any sudden jarring of the whole body or blow on the head could easily produce an interference in the chemical and hydrostatic condition of the brain substance.

With such a background and without definite pathologic changes for observation, the difficulty in evaluating these clinical symptoms that cannot be measured with accuracy, excepting that of loss of hearing and even that is only relative, is readily seen.

Nevertheless, these conditions have to be evaluated and on an equitable basis, so that justice is rendered to the patient and the employer. Much inquiry is necessary on the part of the examiner—namely, (1) general reaction to environment, (2) relationship to his present and past employer, and (3) the desire to rehabilitate oneself.

A working man receiving a concussion may feel that his employer has been negligent, is to blame, and owes him compensation for a loss of time, consequently he develops these postconcussional symptoms of headache, vertigo, vague feeling of insecurity, and a degree of loss of hearing, accompanied by tinnitus—out of all proportion to the injury received.

Comparison of some of these individuals with those who have received similar injuries in sports, such as football, hockey, polo players, cross-country riders, and pugilists, may be made. It is difficult at times to distinguish between a neurosis and a malingerer.

Too many questions or a tentative or positive diagnosis give the individual a basis to refer all his symptoms to.

Nevertheless, it would seem that the majority of those who sit in judgment of these patients, with regard to their real or exaggerated symptoms, definitely feel that the benefit of the doubt should be given to the one entitled to a compensation, provided that his symptoms following an injury appear to be real.

Definitely, the worker has been injured, and, inasmuch as our means are inadequate to measure these conditions in exact figures, approximate compensatory measures must be given. They consist of hospitalization, money, and his job when he has sufficiently recovered to continue.

There is also the safety angle that must be considered, and that is of great importance, particularly in those workers in positions where the safety of others is concerned.

I feel that no physician should assume the responsibility to declare a worker fit for duty when there is a possibility that such a "post-concussioned" worker is definitely a hazard.

I am in accord with Dr. Brown regarding the desire to standardize methods of evaluation, but I feel that careful study should be given before any conclusions are reached in any attempt of the standardization of ratings of disability, measured in terms of dollars. A proper group of otologists, general surgeons, medical men, and neurologists should give this a proper study, and their conclusions should be used as a tentative working basis.

Dr. C. Stewart Nash, Rochester, New York—From Dr. Brown's studies and from my own experience it is apparent that the difficulties arising from the postconcussion syndrome are in inverse ratio to the extent of the injury. Two persons are injured and both have ear symptoms (vertigo, dizziness, stuffiness, noise, and deafness). It is clear why the one with demonstrable head or brain injuries complains, for the more obvious the injury the less difficulty in explaining the symptoms. It is not so clear why the one with an insignificant or minor injury has the same symptoms, for the less the injury, the greater the difficulty in explaining the symptoms.

This raises the question concerning the reality of the postconcussional symptoms in the case of the minor injury. A brief analysis of these symptoms opens up further difficulties.

First, let us consider the acoustic symptoms. If present, the existence of deafness should be determined without much difficulty, as well as its extent and location. Stuffiness that may result from eustachian tube closure, interference with

TABLE 2—PEPTIC ULCER CASES WITH GROSS HEMORRHAGE

Type of Ulcer	Number	Medical Treatment	Deaths	Mortality Rate, Percentage	Surgical Treatment	Deaths	Mortality Rate, Percentage
Duodenal	139	134	4	2.9	5	1	20
Gastric	29	27	8	28.9	1	1	100
Total	168	161	12	7.4	6	2	33.3

It seemed futile to try to draw the line where gross hemorrhage ended and massive hemorrhage began in this group, as they were seen by different observers. However, certain criteria for the diagnosis of peptic ulcer with gross hemorrhage were established. Cases were accepted only if the diagnosis of peptic ulcer was eventually established usually by x-ray and in some cases by surgery or autopsy. The criteria in this series for the gross hemorrhage were (1) hematemesis, melena, or both, (2) symptoms of acute loss of blood varying from weakness to actual shock, and (3) a fall in the hemoglobin and red blood count. The latter did not always occur at the time of admission because of factors of dehydration, shock, etc.

Since the course and treatment of peptic ulcer have varied depending on whether the ulcer was located in the duodenum or stomach, the duodenal and gastric ulcers were studied separately (Table 2).

The duodenal ulcer group was subdivided into those patients who received one or more days of starvation and those who received some sort of feeding, either just milk alone or the Meulengracht type of regimen on the first day of their hemorrhage. The duodenal ulcer patients were also divided into those with their first hemorrhage and those with recurring attacks of bleeding (Table 3).

The gastric ulcer group was not subdivided because of its relatively small number.

Duodenal Ulcer Group

In this group there were 139 cases with gross hemorrhage. One hundred and twenty were men and 19 were women, a ratio of approximately 6 men to 1 woman. Of this group, 134 received medical treatment alone and 5 were eventually operated upon. In the group treated medically there were only 4 deaths due to bleeding, giving a mortality of 2.9 per cent. The cases operated upon for persistent bleeding had 1 death, a mortality of 20 per cent (Table 2, Fig. 1).

The duodenal ulcer cases that were treated medically were separated, as already stated, into two groups, those receiving nothing by mouth during the first day or more of active

TABLE 3—MEDICAL TREATMENT OF DUODENAL ULCER WITH GROSS HEMORRHAGE

Number of Hemorrhages	Number of Cases	Deaths	Mortality Rate, Percentage
First	110	3	3
Recurrent	29	1	3.6
Type of Regimen			
Starvation	99	3	3
Immediate feeding	35	1	3

bleeding and those who were fed immediately. The type of feeding varied from milk to the regimen outlined by Meulengracht.¹ Ninety-nine were treated, more or less, by the orthodox method, and three of those patients died, a mortality just under 3 per cent. Thirty-five patients were fed immediately with only 1 death resulting from bleeding. One died of peritonitis from a perforation after the bleeding had ceased and was not considered a hemorrhagic death. The mortality in this group was also a little less than 3 per cent (Table 3).

These duodenal ulcer patients were also subdivided into those who were admitted for their first hemorrhage and those who had one or more previous attacks of gross bleeding (Table 3). Three patients out of 110 died during their first attack of gross hemorrhage, a mortality of 3 per cent. Twenty-nine people had two or more gross hemorrhages. There was only 1 death in this group, a mortality of 3.6 per cent.

Four patients died on a medical regimen. Case 1 was a 57-year-old syphilitic woman who had no intravenous fluids and died suddenly. Case 2 was a 32-year-old woman thought to have a mesenteric thrombosis, and consequently she was subjected to x-ray studies and was not treated as a bleeding ulcer. Case 3 was a 54-year-old man who died before the real source of trouble was realized. Case 4 was a 36-year-old man who had a purulent cystitis in addition to massive hemorrhage.

The question of the effect of transfusion on the mortality rate cannot be decided. Two of the 4 who died received 500-cc. transfusions and intravenous fluids. But there were numerous 500-cc. transfusions among the people who recovered. However, the records did not

THE MANAGEMENT OF GROSS HEMORRHAGE IN PEPTIC ULCER

A Report of 168 Cases

HARRY L. SEGAL, M D , W J. MERLE SCOTT, M D , Rochester, New York, and
ROLAND S. STEVENS, M D , Chicago

SINCE the advent of Meulengracht's series of articles¹ reporting a definite decrease in the mortality of gastrointestinal hemorrhage by instituting immediate and liberal feedings, many physicians have become confused as to whether to feed or not to feed a bleeding peptic ulcer. Before and since these papers, there have been numerous articles on bleeding peptic ulcer, both as to mortality rate and as to treatment. From the standpoint of mortality, it has been of interest to note that statistics on hemorrhage have varied from 1.3 to 58 per cent. From the standpoint of treatment, Meulengracht¹ has not been the first to use or suggest feedings during the period of bleeding.^{2,3}

Because of this confusion, Crohn and Lerner² reviewed the Mount Sinai Hospital records of cases with acute massive hemorrhage from peptic ulcer. In their paper they criticized many of the former reports and suggested reasons for gross errors in the various statistics in the literature. They further discussed the results of these competing methods of medical treatment. They believed that, because of the difference in criteria for ulcer hemorrhage, the results with the present type of immediate liberal feeding during the period of bleeding were not necessarily better than the orthodox method of starvation during the active bleeding, provided transfusions, etc., were not used too indiscriminately. In their study they found a total mortality of 7.5 per cent—6.8 per cent in duodenal ulcer and 10.3 per cent in gastric ulcer. Blackford and Cole³ in turn criticized Crohn's statistics and mortality rate, stating that the arithmetic appeared grossly in error. They believed that Crohn's mortality rate for massive hemorrhage was actually higher than stated. Even if we discard all the papers in which the work does not seem careful and the diagnosis of peptic ulcer as the cause of the bleeding is not convincing, there still remains much confusion in the mortality statistics. The main cause for this seems

to be that different authors use different criteria for massive hemorrhage and for gross hemorrhage, some use these words interchangeably and do not attempt to differentiate between these two types of bleeding. Thus, it seems difficult to judge the efficacy of the starvation or feeding regimen from the mortality rates of different investigators. We believe this can only be evaluated from results of the same authors before and after the institution of the liberal feeding during the active bleeding.

Meulengracht¹ showed a mortality of 6 to 7.9 per cent in his cases on the old regimen of starvation as against 1.3 per cent with his present plan of liberal feeding (Table 1). LaDue⁴ found a general mortality rate of 6.3 per cent as compared to 1.3 per cent in a group who received immediate feeding as outlined in his paper. He used a mixture of gelatin, lactose, and orange juice every one to one and one-half hours during the active bleeding with a more liberal diet after the bleeding ceased. Woldman and Polan⁵ treated 101 patients with colloidal aluminum hydroxide, either by tube or mouth, during the active period of bleeding and had only 3 deaths, a mortality rate of 3 per cent. They compared this with a group of 38 cases of massive hemorrhage treated at the same hospital during a five-year period preceding the inauguration of his treatment. During that time there were 11 deaths, a mortality rate of 29 per cent. This seems impressive although the conditions were not comparable. The criteria and the observers appeared to be different in these two groups, although this was not stated specifically in their paper.

Because of this confusion we decided to study the status of the peptic ulcer cases with gross hemorrhage occurring in the Strong Memorial and Rochester Municipal hospitals.

TABLE 1—COMPARISON OF MORTALITY STATISTICS

Author	Starvation Percentage	Immediate Feeding Percentage
Meulengracht	6-7.9	1.3
LaDue	6.3	1.3
Woldman	28	3
Our duodenal ulcer series	3	3

Read at the Annual Meeting of the Medical Society of the State of New York, New York City, May 9, 1940.

From the Departments of Medicine and Surgery the University of Rochester School of Medicine and Dentistry.

Let us first consider the physiology and rationale and then outline a treatment.

The rationale of the management of gross hemorrhage has been ably discussed by LaDue⁴ and Browne and Mc Hardy.⁷ When gross hemorrhage occurs, the blood pressure falls to adjust itself to the loss of blood volume. With this, the carotid sinus and aortic reflex may be excited and anoxemia may occur in the medullary centers. Filtration through the kidneys may be lowered with resulting urea retention. Locally, there is contraction of the middle fibromuscular coat of the arteries and clot formation in an attempt to stop the bleeding. If the artery is eroded on end, this contraction helps to stop the bleeding. If the artery is eroded laterally this opening may be widened by such contraction and add to the difficulty of the clot to bridge the gap. An erosion into a vein should be more readily closed by the clot because of the lower pressure.

The important consideration in the treatment is not to interfere with those factors that stop the bleeding, i.e., the lowered blood pressure and the clot formation. However, there are certain dangers, the blood pressure may sink too low and shock may continue, the clot may be displaced by peristaltic waves of the stomach or duodenum or may be digested by the gastric juice. The presence of blood itself in the stomach of some people may be an irritant and may produce nausea, retching, and increased peristaltic activity, thus playing a part in the mechanical dislodgment of the clot. In other people the shock and acute loss of blood may be the cause of the nausea and retching. The blood, in addition, may stimulate gastric secretion beyond its power of neutralization of the excess acid, and digestion of the clot may ensue.

Whether an empty stomach is at rest is a mooted question. Carlson⁸ says it is not. Thus, starvation would not avoid mechanical dislodgment. Moreover, as long as the ulcer bleeds, the stomach is not empty, thus, the chances of an empty or quiet stomach is slight.

Realizing these various factors, what method can one use to gain the best results? The statistical report in our own study does not answer the question. The number of cases in our series that were fed during bleeding is still too small to draw conclusions. By and large, the literature tends to point to a lowered mortality in the group that were fed. However, it can be said that the mortality was not increased by feeding. Moreover, in the average case of gross hemorrhage the patient will not

be exsanguinated, and sufficient clot formation will occur to bridge the gap to stop at least the first bleeding. The important thing seems to be to prevent this clot from being dislodged or digested in order to prevent a recurrence of the bleeding. Alvarez¹⁰ believes that the danger from digesting the clot is greater than that from dislodging it mechanically. If the factor of digestion is all-important, then neutralization of the gastric secretion is an important step in the treatment. It is this factor that can explain the good results claimed by Meulengracht,¹ Woldman,⁵ and others. Frequent feedings or the use of a neutral agent, as colloidal aluminum hydroxide, either by continuous drip or frequent administrations, prevent the digestion of the fibrin and is apparently the rationale behind this treatment. If this is so, Woldman's⁵ method of continuous drip should offer the greater protection by its constant neutralization of the gastric acidity while at the same time avoiding the mechanical factors that solid food itself may produce. Moreover, with a tube in the stomach one may be able to determine when the bleeding has ceased. The end of the tube must not be much lower than the cardiac orifice in order to avoid a mechanical danger of dislodging the clot (Fig. 1). Most ulcers are in the duodenum or, if in the stomach, are in the lower half of it and will not be injured by this technic. In addition, one can lower the head and keep the patient on his back. This helps to keep most of the gastric juice in the cardiac part of the stomach and tends to put the stomach at rest.

If one is reluctant to place a tube in the stomach or if the patient is intolerant to tubes, this position is still of aid. If no tube is used, it is best to start early feedings by mouth to neutralize any excessive acid that may be produced from the stimulation of the blood. For this purpose it is not necessary to start with immediate liberal feedings as Meulengracht¹ has described. Here it seems more rational to follow the diet described by Andresen⁶ in 1927 and 1939. The gelatin mixture has been used with the idea that gelatin combines readily with hydrochloric acid, is soothing and not overstimulating in the production of gastric juice, and is supposedly an excellent coagulant. Gelatin can be dissolved in water to which lactose and fruit juices can be added for nutritional purposes, or the gelatin can be combined with milk, cream, and glucose and flavored to suit the taste. After the active bleeding has ceased, high caloric gruels and milk mixtures can replace the gelatin solutions. Of course, colloidal aluminum hydroxide, etc.,

FIG 1

reveal how carefully and how much time was taken to give these transfusions

Gastric Ulcer Group

In the group of gastric ulcer patients there were 29 cases of gross hemorrhage. Twenty-seven were men and only 2 were women. Twenty-seven patients received medical treatment alone, and 8 of these died, a mortality of 28.5 per cent. Only 1 was operated upon for massive bleeding with a fatality.

Discussion

There are some striking points noted in this study. The mortality for gross hemorrhage from duodenal ulcer was low, slightly less than 3 per cent. This was so in those on a starvation regimen and in those who received immediate feeding.

There is little difference in the mortality rate in the duodenal ulcer series in their first attack of bleeding as compared with recurrent gross hemorrhages. Thus, in our group of duodenal ulcer patients we are forced to say that the mortality is not appreciably greater in a second or third attack of gross bleeding. However, if a patient tends to have recurrent gross hemorrhages, the summation of the mortality of each attack naturally adds to the total risk. Moreover, these people tend to

TABLE 4—AGE INCIDENCE OF THE MEDICAL MORTALITY IN PEPTIC ULCER HEMORRHAGE

Age Group	Duodenal Ulcer			Gastric Ulcer		
	No. of cases	No.	Percentage	No. of cases	No.	Percentage
20-40	48	2	4	2	1	50
40-55	51	1	2	15	2	13
55-	35	1	3	11	5	45
Total	134	4	2.9	28	8	28.5

have more recurrences of bleeding. We feel that repeated gross hemorrhages are a definite indication for eventual surgery. But the indication for immediate surgery is the same as for the first attack, i.e., only if the bleeding persists on the medical regimen. However, surgery in these repeaters should be done after the bleeding has stopped and after the patient is in good condition.

It will be noted from Table 4 that duodenal ulcer hemorrhages occurred more frequently in the age groups from 20 to 40 and 40 to 55 and slightly less often thereafter and that gastric ulcer bleeding occurred more frequently in the groups from 40 to 55 and 55 upward. This is parallel to the age incidence in duodenal and gastric ulcers.

The outstanding fact in bleeding from gastric ulcers is that although its relative frequency is comparable to that of duodenal ulcer the mortality is definitely higher. In our group the medical mortality of gross hemorrhage in gastric ulcer is 28.5 per cent as against only 2.9 per cent for duodenal ulcer. Crohn and Lerner² in their series had a mortality of 10.3 per cent in the gastric ulcer cases as compared to 6.8 per cent in the duodenal ulcer patients. Their total mortality for gross hemorrhage from all peptic ulcer cases was 7.5 per cent. Our total mortality was 7.4 per cent. The factors in the higher death rate from gastric ulcer may be variable. Perhaps mechanical displacement of the clot occurs more readily because of large and more vigorous peristalsis in the stomach. Perhaps digestion of the clot can occur more readily in the acid medium of the stomach than in duodenal ulcer, where the bathing secretions are alkaline.

Medical Management and Its Rationale

Considering our results and those of Crohn and Lerner² and considering Meulengracht's¹ low mortality, Woldman's⁶ success with aluminum hydroxide, and the results reported by Andresen,⁸ Browne and McHardy,⁷ LaDue,⁴ etc., how should one manage the individual case of gross hemorrhage from a peptic ulcer? Should one starve them, should one feed them, or should one operate upon them?

rhage, the immediate effect of which the patient has survived, but persistent bleeding continues many days after the onset of the acute hemorrhage. Usually there is a persistence of ulcer pain or distress. The stools may remain frankly tarry, or, the persistence of bleeding may manifest itself only in a strongly positive test for occult blood. A variant of this type of bleeding occurs when the stools clear up for a short time and then give evidence of recurrent hemorrhage while the patient is being kept in bed on a rigid ulcer regimen. Care must be taken not to mistake the effect of administered iron for occult blood in the stool. In both of the above groups the continuation of the hemorrhage is a danger signal. Either the ulcer is particularly active or the bleeding artery does not become securely closed with a thrombus. We believe that in this small group of cases operation is not only justifiable but may be definitely lifesaving. Five such cases occurred in our duodenal ulcer series, 3 because of continuous bleeding and 2 because of immediate recurrences of oozing which continued. In all of these cases the evidence of bleeding continued for more than ten days before operation was deemed necessary. Four of these patients survived and the bleeding was controlled, while 1 died after operation, giving a mortality of 20 per cent. Thus, a persistent loss of blood over a period of many days (even two or three weeks) is the only type of bleeding from an ulcer which seems to warrant operation directly for its control. The sixth case was operated upon the second day of hemorrhage not because of his bleeding but because symptoms suggested a perforation. An exploratory laparotomy revealed no perforation, and nothing further was done due to the patient's poor condition. The patient continued to bleed and died shortly after the operation. Including this case the total surgical mortality in our duodenal ulcer series was 33.3 per cent.

The point we wish to emphasize is that this patient would not have been operated upon for bleeding if the probability of perforation had not arisen. This case represents a patient early in the course of an acute dangerous loss of blood, a condition to which the physiologic processes of the body had not had sufficient time to adjust. It is generally recognized that surgery offers great hazards at this time. In a week or more the body adapts itself much better to the blood loss.

The problem of recurrent episodes of major hemorrhage, though important, is a separate one from the one that we are considering for

immediate surgery. The recurrent hemorrhage should be managed in the manner already described. However, repeated such episodes may be evidence of an active ulcer and one that often is difficult to control adequately on a conservative regimen. In some of these people, if the blood regenerates rapidly the elective operation may be carried out during the same hospital admission as the major hemorrhage. Ten such cases occurred in our present series, with 1 death. However, with a cooperative patient it seems better judgment usually to defer the operation until complete blood regeneration has occurred when the patient is in the best possible condition.

Summary

One hundred and thirty-nine cases of duodenal ulcer and 29 cases of gastric ulcer with gross hemorrhages have been reviewed.

One hundred and thirty-four of the duodenal ulcer cases were treated medically with a mortality rate of 2.9 per cent. The mortality was approximately the same both in those cases put on a starvation regimen and in those given immediate feedings.

Twenty-eight cases of gastric ulcer with gross hemorrhage were treated medically, with a mortality of 28.5 per cent.

The combined medical mortality was 7.4 per cent for bleeding peptic ulcer in this series.

The rationale and fundamental principles of medical management were discussed.

The only type of patient that should have surgery for immediate control of hemorrhage is when bleeding continues for many days (even two or three weeks). In this small group operation may be a lifesaving measure.

Discussion

Dr Henry A. Rafsky, *New York City*—The more I see of bleeding peptic ulcers, the more I

can be given in addition. If one is still reluctant to start with any feeding, frozen milk cubes can be given by mouth instead of cracked ice. This will keep the mouth moist and the milk dripping in the stomach will have some neutralizing effect.

Naturally, other factors besides the question of clot digestion and clot displacement must be considered. Even if the hemorrhage does not appear dangerous, the patient must be at rest. Morphine and sodium luminal can be used hypodermically for this purpose.

Unfortunately, many cases will have marked blood loss and will be in shock. This must be treated. The patient is kept warm, morphine, as already stated, is indicated, and the moot question of the use of intravenous fluids to replace the blood loss will arise. Crohn and others mentioned by him² are adverse to the use of transfusions except as an extreme measure, and they believe the mortality has been increased thereby. They believe that the drop in blood pressure is a protective mechanism and that to disturb this without due cause may be harmful. Browne and Mc Hardy⁷ believe that transfusions are lifesaving measures and think it is physiologic to replace lost blood with blood if the volume is less than 40 per cent. In our duodenal ulcer patients with gross hemorrhage, transfusions were used fifty-four times in amounts varying from 30 to 600 cc, the usual quantity being 250 to 500 cc. A person can die from too low a blood volume and clinical judgment will be necessary as to when transfusion should be instituted. It is probably best to withhold blood at first but to resort to it if the pulse rate continues to increase and the blood pressure continues at a dangerous shock level. If intravenous fluids are necessary, blood is probably the best medium, and its introduction should be slow in order not to increase the blood pressure suddenly or to its original level.

The discussion of the medical management of the bleeding ulcer has been limited practically to the first few days immediately following the gross bleeding, and this period can be called the period of active bleeding. The period immediately following the actual cessation of the hemorrhage may be called the second period of the medical management. Whether the management of the period of active bleeding consisted of no food, intubation with continuous aluminum hydroxide drip, or frequent administrations of milk or gelatin mixtures, frequent liberal feedings should be the mode of procedure in this second period. Now we can follow Meulengracht's¹ idea of a

diet rich in scraped meats, milk, bread, butter, cream, cheese, eggs, vegetables, tea, etc. The argument that the Meulengracht's¹ regimen helped clot formation, brought about rapid convalescence, and prevented nutritional loss may be true, but, if this regimen is started on the third day after the onset of the hemorrhage, no great nutritional harm has been done, and no harm has been done to the clot if the patient has been at rest and other neutralizing factors have been at play. It is the old type Sippy regimen of starvation and gradual step-up of the feedings that lasted two to three weeks which does the nutritional harm. This regimen should not be used.

Surgery

So far we have been concerned with the medical regimen. The part surgery should play in gross hemorrhage from peptic ulcer must be discussed.

In the duodenal ulcer series surgery was not employed as an emergency measure in an attempt to stop a rapidly fatal hemorrhage. There are a few cases in which the physical conditions are such that the bleeding from the eroded artery may not stop, an erosion on the lateral wall or arteriosclerosis may prevent the artery eroded on end from contracting. If these facts could be determined with accuracy in the individual case, then it would be wise to use the massive transfusion method now available and operate on such individuals. However, many of the patients in this series who came in with massive hemorrhage and developed profound shock survived on a medical regimen, although it was feared that they would not. There is nothing in the physical examination of the patient before he is actually moribund and there is no test available which will differentiate in acute hemorrhage the patient who will ultimately survive from the one who will continuously and rapidly bleed to death. We are convinced that, even with the aid of improved methods in giving huge quantities of blood, the operative mortality for massive hemorrhage in duodenal ulcer is greater than the mortality of this condition under the conservative treatment outlined—7.4 per cent in the whole series but only 3 per cent in the duodenal ulcer. Therefore, it seems wise to continue our policy not to operate as an emergency in a desperate attempt to control a massive hemorrhage.

There is, however, one type of bleeding from an ulcer which we believe does usually call for operative interference. The bleeding episode usually starts with a major hemor-

A CASE OF PAPILLARY CARCINOMA IN A HORSESHOE KIDNEY

JOHN S FITZGERALD, M D , Utica, New York

HORSESHOE kidney is an uncommon congenital anomaly of great clinical interest and the problems of diagnosis and treatment are among the most intriguing in urology. Such a kidney is more likely to develop other lesions than a normal kidney. Many tumors, most of which have been hypernephromas, have been found associated with this anomaly. A review of the literature has failed to reveal a report of the occurrence of papillary carcinoma in a horseshoe kidney. For this reason, the following case is presented.

Case Report

The patient, F P , a white man, aged 50, was referred to me by Dr R C Ainsworth on March 3, 1939, with a complaint of severe pain in the left side and gross hematuria of twelve hours' duration. There had been two previous attacks of hematuria, nine months and five months previously. These had ceased spontaneously and had not led him to seek medical advice. He had been treated, however, off and on for four years for "kidney trouble." The remainder of the past history had little bearing on the case. Twelve years earlier, all the upper teeth were removed for Vincent's angina. Seven years prior he fell and suffered a back injury that involved the right but not the left side. The x-rays taken at the time showed an osteoarthritis of the lumbar spine. No mention was made of the kidney shadow. He had lost 15 pounds in six months, this he ascribed to hard work and a severe attack of right sciatica just prior to the onset of present illness. His mother had died of carcinoma of the uterus.

On physical examination an obese man of middle age was found. He appeared acutely ill and in severe pain.

Head. The pupils were equal, round, and reacted to light and accommodation, sclerae were normal. The ears and nose were normal, but the upper teeth were absent.

Neck. No glands or pulsations were noted. Thyroid was not palpable.

Chest. The heart was normal in size and shape, and the sounds and rhythm were normal. Vessels were soft. The blood pressure was 120/80.

Abdomen. The abdomen was soft. There was marked tenderness and slight rigidity on deep palpation in the left flank and at the left costovertebral angle. No mass or kidney was palpable on either side. The bladder was not palpable or tender.

The external genitalia were normal except for

blood staining. The prostate was of normal size, shape, and consistency.

The urine was dark red, cloudy, and alkaline, with a specific gravity of 1.010. The albumin was 3 plus, and there were a few leukocytes and many erythrocytes. Tests for sugar and acetone were negative. The blood Wassermann was negative.

Cystoscopy was performed immediately. A slim clot, the cast of an ureter, was found in the bladder. At meatoscopy, normal urine appeared from the right ureter and grossly bloody urine from the left. Indigo carmine appeared in medium concentration on the right in ten minutes. None was noticed on the left. A number 6 catheter was passed easily to the kidney pelvis on each side. The specimen was clear on the right and bloody on the left. Smear and culture did not reveal any organisms.

The first film revealed the catheters to ascend in rather straight fashion to reach the level of the kidneys on each side then turn sharply outward and dip downward.

The left pyelogram revealed only a portion of the pelvis and the lower calix to be filled. Above this there was an irregular infiltration of the dye that bore no resemblance to a kidney pelvis. The ureter below was straight and well filled. The right pyelogram was indistinct but showed a pelvis close to the midline and a rotated kidney. The minor calices were clean cut and well filled.

The complete blood count revealed a hemoglobin of 66 per cent, red blood cells, 3,250,000, and white blood cells, 13,400, of which 76 were polymorphonuclears and 18 per cent were small lymphocytes.

Because of the severity of the hemorrhage, nephrectomy was performed without delay. The preoperative diagnosis was kidney tumor. The horseshoe was not discovered until operation.

Under cyclopropane anesthesia, the patient was placed on his back, and an 8-inch left pararectus incision was made. A 6-inch crossbar was made so that the entire incision was T shaped. The extraperitoneal space was dissected until the psoas muscle and almost the midline was reached, but it was impossible to find the left kidney. The patient was turned on the side and the bar of the "T" extended. The kidney was then found and freed easily, except at the lower pole where the attachment was discovered. The ureter crossed anterior to the bar and was severed. Between clamps the isthmus was divided. The stump of the isthmus was covered with fat, anchored by number 00 chromic continuous suture. Dissection of the pedicle was difficult due to the fact that the blood supply entered in four places, each of which required individual clamp and ligature. No single large

am convinced that the treatment of each case must be individualized. Various factors must be taken into account when trying to arrive at any conclusions in these cases. During the past six months I have seen more bleeding peptic ulcers at the Lenox Hill and Beth Israel hospitals than in any other similar period. Whether or not this is due to the severity of the winter (or whatever the cause is) I have not been able to ascertain. Furthermore, these bleeding cases have been severe ones. When we compare mortality statistics we must bear in mind that some patients do not seek medical treatment until they are almost exsanguinated. This was demonstrated by a patient who came into the hospital with a hemoglobin of 28 per cent, he had been bleeding about one week before admission. Other patients seek advice at the initial onset of the symptoms. With regard to the various methods of treating bleeding ulcers, I have tried the Meulengracht diet, duodenal feeding, intragastric drip, and the Sippy plan. The results are about the same, irrespective of the method

employed. Dr Einhorn many years ago gave high caloric and high protein feedings through the duodenal tube, and I still use this method in bleeding ulcers. With regard to the Meulengracht diet, I have seen 2 cases in the past five months in which the bleeding started again after the patient had been on the diet about one week. Another point to be emphasized is the question of prerenal azotemia. The determination of the nonprotein nitrogen is important. In a previous article Dr Weingarten and I showed that the nonprotein levels have prognostic values. The dehydration in prerenal azotemia must be overcome. If the nonprotein nitrogen level does not fall, irrespective of the therapeutic efforts, the prognosis is bad. The nonprotein levels do not have any relation to the anemia. With regard to transfusions, I am not in agreement with those observers who say that transfusions are not indicated. I feel they are definitely indicated to overcome the anemia and the dehydration resulting in azotemia, but small and frequent transfusions should be given instead of large ones.

They Can't Wait Much Longer

Stricken Civilians in England and Greece Need Your Help Today

The Medical and Surgical Supply Committee of America desires to send 1,000 emergency operating sets in khaki canvas rolls and 1,000 fitted first-aid metal cases. These units have been approved, both as to contents and containers, by the surgeons and physicians of this committee. Bombed hospitals, emergency first-aid posts, air-raid shelters, and recently opened auxiliary provincial hospitals are in dire need of instruments to replace losses made almost nightly!

This is a frank appeal to you to come to the assistance of the stricken civilian population of Great Britain and her Allies. If you can interest anyone or any group of people (clubs, factories, commercial organizations, service groups) in your vicinity in the purchase of one or more of these sets, please let us know. Each set will bear a plate with the donor's name, if desired. The price, delivered in England, insurance and shipment included, is \$200 for the Emergency Operating Set and \$70 for the First-Aid Fitted Case.

*Please make checks payable to Arthur Kunzinger,
Treasurer, Medical and Surgical Supply Committee of
America, 420 Lexington Avenue, New York City*

cured. The wound cleared quickly under a Dakin's dressing. A right sciatica developed which responded to sacral injection and vitamin B. He was discharged thirty-four days following operation with a small granulating area remaining in the wound. This filled in rapidly and he returned to work about three months postoperatively.

A check-up examination was performed nine months later. At cystoscopy, the bladder was normal. There was no evidence of growth in the bladder, and the left ureteral orifice was normal. A uereterogram of the left side showed smooth walls in the stump of the ureter. Indigo-carmin was given and did not appear in twenty minutes from the right. A few days later a gross phenolsulfonphthalein test was performed and revealed 35 per cent in the first half hour, 15 in the second, 8 in the third, and 3 in the fourth, a total of 61 per cent. Intravenous urogram was performed, a picture seven minutes after the injection of 30 cc of diodrast revealed no left kidney shadow. On the right side the kidney shadow was well visualized, particularly in its upper and lateral portions. It was larger and broader than normal and the inner border approximated the vertebral column. The lower pole was squared, but there was no definite bar seen. There was moderate lipping of the vertebrae due to arthritis. The pelvis was well filled, with calices arising both medially and laterally and at the inferior portion so that the picture resembled a porpoise. At thirty-five minutes, the bladder showed beginning filling and the kidney was beginning to empty. The ureter was not visualized.

At present there is moderate diastasis of the rectus muscle medial to the wound. For this he wears a belt. Otherwise, he is in good physical condition and states he feels better than he has in years.

The preoperative diagnosis was kidney tumor, the fusion not being detected until operation. Because of the obesity of the patient the pyelograms were quite indistinct, and it required a good deal of imagination to see the connecting bar even after you knew it was there. The left pelvis was greatly distorted by the tumor. The right showed the bizarre pelvis and the lack of rotation. Both kidneys were low and close to the midline. In the postoperative intravenous urogram, this was fairly well demonstrated.

Many excellent treatises have been written on horseshoe kidney, the monograph of Gutierrez¹ being particularly helpful. Although pelvic changes are usually diagnostic, probably the best aid in diagnosis is visualization of the bar by intravenous urography in the early pictures.

This anomaly is so frequently the site of superimposed pathology that infection and

stone are frequently found. Hypernephroma has been reported many times. Squamous cell carcinoma has been reported by Primrose,² Melen and Gaspar,³ Willan,⁴ Nicholson,⁵ and Perrier.⁶ Morley⁷ reports a benign papilloma in the horseshoe kidney. These were studied at postmortem examination. De Vries⁸ reported a case of stone, papilloma, and hypernephroma in a patient who was operated upon with good results. Kimbrough⁹ reported a case of papillary adenocarcinoma in an operative case of horseshoe kidney.

Conclusion

A case report of a papillary carcinoma occurring in a horseshoe kidney has been presented.

Discussion

Dr W. J. Kennedy, *Utica, New York*.—I want to congratulate Dr Fitzgerald on his fine presentation and skillful management of a difficult case.

Even when horseshoe kidney is recognized preoperatively, surgery on such a kidney is usually technically difficult because of the fixed position of the fused pole and the bizarre arrangement of the blood supply.

Gutierrez has described what he calls, "the horseshoe kidney syndrome." This consists of abdominal pain located in the epigastric or umbilical region, a history of life-long constipation, and recurring attacks of urinary disturbances of the type that are prone to develop in the presence of obstruction, stasis, or infection. The first two are always present in some degree in horseshoe kidney due to the fact that the ureter always crosses some portion of the kidney, usually the isthmus, and infection occurs as the natural sequel to obstruction. Bilateral pyelograms are essential in diagnosis, and intravenous pyelograms are perhaps more valuable than retrograde, since occasionally one is enabled to visualize the isthmus. One should suspect fused kidney (1) when the kidneys are low without the usual ureteral changes suggestive of ptosis, (2) when the kidneys are situated abnormally close to the spine, and (3) when there is rotation of the pelvis and inversion of the calices causing some or all of them to point toward the spine. When fusion

FIG 1 Anterior view showing pelvis on anterior surface. The isthmus is at the lower left-hand corner. The four pins are in the arteries.

vessel was present. The kidney was excised. A cigarette drain was placed in the bed of the kidney and a tube drain to the isthmus. The wound was then closed in layers, using number 2 chromic running suture to the fascia and muscle, silk retention and continuous to the skin.

The kidney was enlarged to about twice the normal size, particularly in the upper portion where it felt quite firm. Much of the pelvis was extrarenal and firm to palpation. The ureter crossed anterior to the horseshoe bar. At the lower pole on the medial side was the stump of the isthmus, which was firm. Four small arteries provided the blood supply to the kidney. These entered in varying relation to the pelvis. On section the entire upper two-thirds of the pelvis was filled with a papillary growth that obstructed all the upper calices and filled this entire area. The remaining unfilled portion of the pelvis was small and irregular and drained only the two lower calices. In the lower portion of the papillary growth an erosion was present. This was undoubtedly the source of the severe hemorrhage.

The report of the pathologist was papillary carcinoma. The State Institute at Buffalo confirmed this. I am indebted to Dr J E Ash of the Carcinoma Registry for the following excellent description: "The tumor involving apparently only the pelvis consists of papillae of

FIG 2 Interior view showing carcinoma filling the upper two-thirds of the pelvis.

considerable length having very delicate but vascular connective tissue cores and layers of transitional type of epithelium which are very broad at the base but thinned out somewhat toward the tips. The epithelium is rather uniform in size and shape showing no tendency to differentiation toward the squamous, mitoses are not frequent, the basal cells are rather uniformly palisaded, but the overlying cells, particularly in the thicker layers, are apt to be more disorderly in arrangement. There is no evidence of penetration beyond the basement membrane. Graded on the same basis as bladder tumors this would be a carcinoma, papillary, grade I. The block taken from the kidney at the line of fusion shows, under the low power particularly, the complete separation of the two kidney masses by connective tissue. Under the high power it can be seen that the glomeruli and large blood vessels are either at or very close to this line of separation. There are foci of lymphocytic infiltration into both kidney masses and focal areas of fibrosis, arteriosclerotic in origin in both. The diagnosis here would be fused horseshoe kidney, arteriosclerosis."

The postoperative course was stormy. After a favorable preliminary response he developed a cough, with expectoration, rales, and severe distention. The temperature rose to 104 F. He responded to intensive treatment that included continuous nasal gastric suction and intravenous fluids. A week postoperatively his general condition was good, the urinary output was satisfactory, but the limb of the T incision was infected. A fascial slough with undermining occurred in this area. No urinary drainage oc-

TUMORS OF THE BLADDER

HENRY G. BUGBEE, M D, New York City

THE most controversial subject in urology is tumors of the bladder, for conclusions and current opinion regarding the results obtained from various methods of treatment are based more upon personal opinion than upon well-established facts. Not until we standardize our classification of bladder tumors so that we are talking of the same type of tumor for which we are applying various methods of treatment will it be possible to appraise correctly the true value of each method.

It seems to me that a simple and understandable classification of bladder tumors is one recently published from the Cleveland Clinic. In this classification tumors are divided into papillary and nonpapillary infiltrating tumors. The papillary tumors are subdivided into noninfiltrating, so-called benign papillomas and malignant papillomas, while infiltrating papillomas are subdivided into papillary carcinoma and infiltrating papillary carcinoma. The nonpapillary infiltrating carcinoma represents the broad base, sessile, nodular, often ulcerated growths with evidence of invasion of the bladder wall. In this general discussion rare types of benign tumors of the bladder, such as fibroma, cystadenoma, etc., also sarcoma, may be excluded.

We probably all subscribe to the premise that all tumors of the bladder are potentially malignant. The arguments that have so often been given for considering so-called benign papillomas as grade I malignancy seem well founded. Broder's gradation of tumors according to their cellular differentiation seems to be the best index of the inherent malignancy of the tumor and has been adopted by most pathologists and clinicians as a working basis although the variability in the histologic structure of different areas of the same tumor is well recognized. As a basis for prognosis, the reliability of this gradation is open to serious question.

Two elements handicap us at the start in dealing with bladder tumors. One is that they occur in individuals of late, middle, or advanced age in a large proportion of cases. Second, because of the often late appearance of symptoms, a diagnosis is frequently made only when the pathology, both local and general, is well established. Hematuria, the most

common primary symptom, is generally painless and intermittent and is too frequently treated lightly, while dysuria, frequency, and changes of the urinary stream except in the presence of tumors encroaching upon the vesical outlet are late in their appearance.

Unquestionably, our important diagnostic procedure in bladder tumors is a cystoscopic examination, which should be made in every case of hematuria unless there is some definite reason to the contrary. Painstaking cystoscopic study of a bladder tumor—noting its position, size, and general appearance, the condition of the tumor pedicle and bladder wall, the vesical neck, and ureteral orifices—gives us more information than can be obtained by any other single method of examination. Also, if multiple tumors are present, they will be detected at once. This information, however, should be supplemented by data acquired through excretory urography by which means the possible existence of a kidney or ureteral tumor may be demonstrated and the bladder papilloma shown to be an implant. The presence of renal infection with or without hydronephrosis, ureteral dilatation, and impaired kidney function may be ascertained in this manner. These factors may well influence the type of treatment to be instituted. Furthermore, defects of bladder outline caused by bladder tumors are as a rule more satisfactorily demonstrated by excretory urograms than by cystography, the size, position, and number of growths, as well as possible infiltration of the bladder wall, often being outlined in this manner. A search by physical examination and x-rays for the possible presence of metastases should supplement the urologic study, and a knowledge of the condition of the blood stream is essential at all times.

Given a diagnosis of a bladder tumor, what will be our treatment? A cursory review of the literature upon this subject for the past thirty-five years reveals a continuous succession of new methods, the immediate enthusiasm for each innovation and the subsequent difference of opinion as to its real value give one the definite impression that on the whole the results have been disappointing.

At the beginning of this period some type of surgery was our only recourse. Then fulguration was introduced and met with decided favor. As its limitations became apparent, a

occurs in the lower pole, the lower calices are often close together, and occasionally one or both may actually cross the spinal column. This fact has been utilized by Gutierrez in an ingenious manner. He constructs a triangle, using a line drawn between the tips of the innermost calices as a base and the midpoint of a line drawn between the iliac crests as the apex. In the normal kidney the angle is about 90 degrees, while in the horseshoe kidney it varies from 7 degrees to 36 degrees and is usually less than 20 degrees.

Papillary tumors of the renal pelvis are not especially rare but may be somewhat difficult to differentiate preoperatively. They are identical in every respect save that of location to papillary tumors of the bladder. They may be either single or multiple, may arise from a slender pedicle or a broad base, they have the same tendency to form implants and, like bladder papilloma, tend to metastasize late. The only constant symptom of tumor of the renal pelvis is hematuria. In papilloma the bleeding usually occurs early, while in squamous carcinoma bleeding usually occurs late. Pain, which is usually sudden in onset and which may closely simulate that of calculus disease, occurs fairly frequently.

This was noted in Dr. Fitzgerald's case, and it was the chief symptom in a patient of mine operated on recently.

Blood clots in the kidney pelvis cause pyelographic filling defects easily mistaken for pelvic tumor. But clots will usually retract or pass, and a repeat pyelogram after a short interval will clear up this point.

Pyelitis cystica may present a pyelographic appearance closely simulating the irregular mottled appearance sometimes present in papilloma. This similarity, however, is more apt to be confusing when the lesion extends into the ureter than when it is confined to the kidney pelvis.

In addition to the hydronephrosis which always occurs in papillary tumor of the kidney pelvis, there are two other signs that to me are of great diagnostic value. Bleeding may be started or aggravated by the passage of the ureteral catheter, and in a recent case the urine became perfectly clear after the catheter had passed beyond the tumor which was situated at the ureteropelvic junction and, secondly, a peculiar mottled appearance of the pelvis when filled with pyelographic mediums which are not too dense to obscure the irregular contour of the papillary growth.

BETTER BABY

I am a modern baby who must face
Inheritances of the human race,

But medicine and science both combine
To make this prophylactic life of mine

I'm glad I need not worry over sties
Because of argyrol dropped in my eyes

And fingerprints will guard my name from doom,
While I enjoy my air-conditioned room

At breakfast time I'm taken from my crib
To don my waterproof, transparent bib

Then mashed bananas, milk, tomato juice,
Strained vegetables in cans all serve my use

Tucked in my sleeping bag, the zippers run
Up to my neck, while napping in the sun

But I don't mind if days are cold and damp,
I eat my sun, or get it from a lamp

My arm of punctured serums has a sore
To keep that yellow sign from off our door

And relatives who in my glee would bask
Must hide behind a germ protecting mask

But streamlined gadgets cannot alter me,
My temper is old-fashioned as can be

And when I shriek my loudest false alarms,
I want to snuggle close in mother's arms

ADVICE FROM AN EXPERT

No one can accuse former Governor Alfred E. Smith of indifference to the public welfare or hostility to beneficial social change, remarks the *New York Medical Week*. During his Albany years he fought successfully for many important welfare measures which profoundly influenced social attitudes not merely in this state but in the nation. In spite of his opposition to many aspects of the New Deal, he supported unemployment relief and old-age pensions.

It is therefore as a friend of the public as well as the medical profession that Mr. Smith speaks when he urges the latter to organize itself frankly as a "pressure group" in order to protect its interests. The former governor predicts that the Federal Government will first seize control of the life insurance companies and then follow through with obligatory prepayment for sickness. Unless physicians "organize and see that they are represented in any discussion of the subject, some socialistic group in Washington will give us a form of health insurance that will not be as good as you [i.e., the medical profession] can give us."

Mr. Smith correctly asserts that "organized minorities can exert great pressure" in government today—whether for better or for worse. The medical profession does not place self-interest above the common good. On the contrary, it is convinced that the preservation of its independence is to the public advantage, and that the defeat of compulsory sickness insurance is as essential to the general welfare as to its own. Under these circumstances it should not hesitate to follow Mr. Smith's advice and fight the pressure of the minority seeking obligatory insurance with organized counter-pressure of its own.

TUMORS OF THE BLADDER

HENRY G. BUGBEE, M D, New York City

THE most controversial subject in urology is tumors of the bladder, for conclusions and current opinion regarding the results obtained from various methods of treatment are based more upon personal opinion than upon well-established facts. Not until we standardize our classification of bladder tumors so that we are talking of the same type of tumor for which we are applying various methods of treatment will it be possible to appraise correctly the true value of each method.

It seems to me that a simple and understandable classification of bladder tumors is one recently published from the Cleveland Clinic. In this classification tumors are divided into papillary and nonpapillary infiltrating tumors. The papillary tumors are subdivided into noninfiltrating, so-called benign papillomas and malignant papillomas, while infiltrating papillomas are subdivided into papillary carcinoma and infiltrating papillary carcinoma. The nonpapillary infiltrating carcinoma represents the broad base, sessile, nodular, often ulcerated growths with evidence of invasion of the bladder wall. In this general discussion rare types of benign tumors of the bladder, such as fibroma, cystadenoma, etc., also sarcoma, may be excluded.

We probably all subscribe to the premise that all tumors of the bladder are potentially malignant. The arguments that have so often been given for considering so-called benign papillomas as grade I malignancy seem well founded. Broder's gradation of tumors according to their cellular differentiation seems to be the best index of the inherent malignancy of the tumor and has been adopted by most pathologists and clinicians as a working basis although the variability in the histologic structure of different areas of the same tumor is well recognized. As a basis for prognosis, the reliability of this gradation is open to serious question.

Two elements handicap us at the start in dealing with bladder tumors. One is that they occur in individuals of late, middle, or advanced age in a large proportion of cases. Second, because of the often late appearance of symptoms, a diagnosis is frequently made only when the pathology, both local and general, is well established. Hematuria, the most

common primary symptom, is generally painless and intermittent and is too frequently treated lightly, while dysuria, frequency, and changes of the urinary stream except in the presence of tumors encroaching upon the vesical outlet are late in their appearance.

Unquestionably, our important diagnostic procedure in bladder tumors is a cystoscopic examination, which should be made in every case of hematuria unless there is some definite reason to the contrary. Painstaking cystoscopic study of a bladder tumor—noting its position, size, and general appearance, the condition of the tumor pedicle and bladder wall, the vesical neck, and ureteral orifices—gives us more information than can be obtained by any other single method of examination. Also, if multiple tumors are present, they will be detected at once. This information, however, should be supplemented by data acquired through excretory urography by which means the possible existence of a kidney or ureteral tumor may be demonstrated and the bladder papilloma shown to be an implant. The presence of renal infection with or without hydronephrosis, ureteral dilatation, and impaired kidney function may be ascertained in this manner. These factors may well influence the type of treatment to be instituted. Furthermore, defects of bladder outline caused by bladder tumors are as a rule more satisfactorily demonstrated by excretory urograms than by cystography, the size, position, and number of growths, as well as possible infiltration of the bladder wall, often being outlined in this manner. A search by physical examination and x-rays for the possible presence of metastases should supplement the urologic study, and a knowledge of the condition of the blood stream is essential at all times.

Given a diagnosis of a bladder tumor, what will be our treatment? A cursory review of the literature upon this subject for the past thirty-five years reveals a continuous succession of new methods, the immediate enthusiasm for each innovation and the subsequent difference of opinion as to its real value give one the definite impression that on the whole the results have been disappointing.

At the beginning of this period some type of surgery was our only recourse. Then fulguration was introduced and met with decided favor. As its limitations became apparent, a

combination of fulguration, diathermy, and surgery had its day. Radiation in the form of radium and x-ray therapy followed and was extensively employed by urologists in general. With the advent of transurethral resection, the resectoscope has come into common use as a rapid and efficient means of removing pedunculated bladder tumors and applying fulguration. Finally, cystectomy—thanks to the advancement made in surgical technique—has been resorted to more often, and now we hear murmurs of refrigeration as a therapeutic measure. X-ray therapy has taken on new life with the inception of machines of higher voltage.

Combinations of these various methods of treatment have been employed by nearly all urologists, and for this reason it has been extremely difficult to appraise accurately the true value of any one method. Furthermore, the results obtained have been so confused by the lack of a uniform clinicopathologic classification of tumors that reports of favorable results have often been misleading. Proper facilities for carrying out certain methods of treatment, especially radiation, are not often available. These are a sufficient supply of radium, a high-voltage x-ray machine, and a group of co-workers including a chemist, physicist, pathologist, and roentgenologist, all of whom are so essential for the satisfactory execution of this type of therapy. Unquestionably, urologists who can command such working facilities may be expected to obtain much better results from this method of treatment than can those who have had less experience and are handicapped through lack of equipment and associates. Likewise, urologists of wide surgical experience and unusual technical skill should obtain better results from surgery as applied to tumors of the bladder than the less experienced and less skillful operators. The same applies to transurethral operative procedures. Therefore, one must be understanding and liberal in evaluating these various methods of treatment, making due allowance for the personal element that enters into the reports of individual urologists.

Just where do we stand today with regard to the application of these various methods of treatment? Unquestionably, each case should be treated individually, the type of treatment being fitted to the case and being dependent upon the size, position, and classification of the tumor as determined by cystoscopic examination and biopsy, as well as a knowledge of the state of the upper part of the

urinary tract acquired by excretory urography. There is little difference of opinion with regard to the efficacy of fulguration in the treatment of villosa papillomas of low-grade malignancy, and in this regard the rapid removal and destruction of these growths with the resectoscope has largely supplanted the slower method of fulguration with small electrodes. The only divergence of opinion in the treatment of this type of tumor is whether in multiple or large papillomas open surgery is not sometimes preferable. As in the transurethral resection of the prostate, with experience one becomes more expert in the use of the resectoscope and finds it possible to tackle and eliminate larger growths with entire satisfaction. Transurethral excision of bladder tumors requires skill and experience, for it is necessary to remove all of the tumor or tumors and fulgurate the pedicle or base. I have found it possible to free entirely a bladder of multiple growths that, in several instances, almost completely filled the bladder cavity. This is done by repeating the resection at weekly intervals until clear. Such bladders when once freed of growth have been kept clear by observations at regular intervals, occasionally destroying small recurrences (which means new growths in other areas of the mucous membrane as they have appeared). Open operation in these cases is unsatisfactory since recurrences are the rule, and they seem to occur sooner following open surgery than after transurethral resection. I have not seen a case of this type in which I felt that a total cystectomy was indicated.

Transurethral excision has also been carried out satisfactorily in a series of cases of malignant papilloma and papillary carcinoma even when infiltration of the pedicle has taken place. Such tumors when located in the trigon and adjacent to the vesical outlet have in 8 instances been resected along with the prostate. With the elimination of the prostate allowing better vision and more room for manipulation, it has been possible to resect the tumor pedicle. All of these patients have remained free of growth up to five years with 1 exception, this patient succumbing to a heart attack after four years of freedom from tumor. A papillary carcinoma located in the fundus or lateral walls of the bladder and not encroaching upon the vesical outlet or both ureteral orifices may often be removed by surgical resection of the bladder wall. Transplantation of a ureter enhances the danger of kidney infection. It is in this type of tumor that radiation has been extensively employed.

by some, radon seeds being inserted into the pedicle after the growth has been destroyed or excised. X-ray therapy has also been utilized in these cases, the most recent modification of its administration being the direct application of roentgen therapy by means of a tube inserted into the open bladder, the rays emanating from the end of the tube.

I have employed radium for many years both singly and in combination with surgery and fulguration, but recently I have used it less and less because it seemed to increase infection, and dysuria, frequency, and local pain were often distressing. Of late, x-ray therapy has been used more frequently after resection of the tumor. From 50 to 60 per cent of cures may be expected in the papillary type of cases, notwithstanding the fact that occasionally what seems to be a comparatively small intravesical growth proves to be but the apex of a growth having a broad base in the deeper layers of the bladder wall or in a large extravescicular tumor.

Infiltrating, nonpapillary carcinoma of the bladder presents a different problem. When such a tumor is located in the fundus and is movable, bladder resection may be undertaken, but unfortunately over two-thirds of these tumors are located on the posterior wall and involve the trigon. Rarely when a tumor is placed in this location is the case suitable for partial or complete cystectomy, for the growth has probably extended beyond the bladder and metastases are already present. Radiation has been extensively employed in this class of cases, although such tumors are apparently radioresistant in many instances. The superficial growth may often be removed with the resectoscope, and x-ray therapy may be given with beneficial effect to the extent of helping a slough to separate, healing ulcerations, and relieving pain. Two recent cases of this type are worthy of brief mention.

Case Reports

A woman, aged 72, entered the hospital complaining of dysuria, frequency, and great difficulty in voiding, the urine contained blood in small clots. Cystoscopic examination revealed an ulcerated, infiltrating growth that involved the trigon and lateral walls of the bladder, at least half of the bladder wall being invaded. The growth extended along and surrounded the urethra and could easily be palpated through the vaginal wall. The growth was fulgurated and the superficial layers were removed with the resectoscope. Biopsy showed a grade IV carcinoma. Urination became so difficult that a cystostomy was considered, but it was decided

to first try radiation by x-ray. The patient began to improve at once, and in four months no evidence of the growth was visible on cystoscopic examination or could be palpated through the vagina. Urination became free and the urine clear. I examined this patient one week ago and her condition remains the same. She has been free of symptoms and the bladder has been clear for eight months. Her general physical condition is excellent.

A second case, a man, aged 69, was operated upon elsewhere, and an infiltrating carcinoma surrounding the vesical neck and extending to the lateral walls and base of the bladder was removed superficially by diathermy applied through the open bladder. There was a rapid recurrence of the growth, and when I first saw him he had almost constant urination amounting to incontinence. Dysuria was distressing and the urine contained aropy mucus, pus, and blood. Local treatment gave no relief. Cystoscopic examination showed an ulcerating, infiltrating growth involving the trigon, vesical neck, and base and lateral walls of the bladder. He was placed in the hospital and given deep x-ray therapy. The first doses were massive ones and caused severe toxemia, after which treatments were given intermittently and in smaller doses. He began to improve and passed large sloughs of tissue which at times completely blocked the urethra necessitating their instrumental removal. After two months these sloughs disappeared, and in three months from the beginning of the x-ray treatment no growth was visible on the surface of the bladder. He has now gone four months without treatment and, while he has a contracted bladder and voids about once an hour, he is free from pain or discomfort. The urine is usually clear and free from odor and is acid. He has gained 20 pounds in weight and says that he feels better than he has in years.

I do not cite these 2 cases as cures. One cannot say that nests of cancer cells are not still present in the bladder wall. But, if they are present, they are encased in fibrous tissue. I know of no other treatment that would have given an equally satisfactory temporary result.

Infiltrating growths are said to be radioinsensitive. It seems to me that it is difficult to generalize to this extent in speaking of bladder tumors and that one must be guided by observing the reaction to treatment which takes place in the individual case. Tumors of low-grade malignancy may occasionally be resistant to all types of treatment, while others of high-grade malignancy will from time to time surprise us by reacting at once to various types of treatment. Two urologists associated with the same institution in which

radiation is extensively employed have divergent opinions. One says that x-ray radiation has failed, that alone it is not sufficient, that most bladder tumors are radio-insensitive, and that better results may be obtained by routinely employing radium than by any other method of treatment. The other observer, while employing radium to a certain extent, is definitely more enthusiastic regarding the benefits to be derived from deep x-ray therapy. The recent statement by Colonel Ash of the Bladder Tumor Registry is of interest. He says "I have been impressed by the severity of secondary reactions in those cases that have been subjected to irradiation, particularly deep x-ray therapy. It also seemed that results obtained in those clinics where radiation was used at a minimum were at least equally as good as those in clinics where irradiation was used routinely." Further "In view of the fact that as a class these tumors are resistant to irradiation and considering the possibility of serious damage from the irradiation, it would seem a mistake to use it routinely, and this in spite of the number of glowing accounts of the results that have been obtained through irradiation. It seems very doubtful that any case that could be cured by irradiation could not be cured by skillful surgery, which includes fulguration, of course."

We still have a difficult problem in the treat-

ment of bladder tumors. It seems to me, however, that we can feel definitely encouraged with the results now being obtained in all types of pedunculated tumors. The removal of these tumors with a resectoscope and treatment of the base by fulguration or radiation in one form or another, also occasional open resections of the bladder, will give us a goodly proportion of cures—estimated by various observers as 50 to 60 per cent of five-year cures. These figures correspond with my own experience, 78 per cent of our cases of this type are alive.

In the management of infiltrating, nonpapillary growths we are faced with a different problem. Here the possibility of bladder resection or total cystectomy is to be borne in mind should the growth still be localized to the bladder wall and the upper part of the urinary tract show little infection or dilatation. If infection and dilatation are present, cutaneous ureterostomy may be the procedure of choice. At present, x-ray therapy seems to offer us slightly more encouragement than formerly in this class of cases, and various combinations of treatment are often indicated.

Early diagnosis is still the prime requisite in the treatment of bladder tumors, and operation is but the first step in the cure, a rigid follow-up being absolutely necessary in every instance.

THE SIMPLE SERUM

(Dr Charles Armstrong of the United States Public Health service says the common cold stimulates white blood cells in the nose and these immunize mice against encephalitis and poliomyelitis. Colds probably are protectors of men as well, he believes.)

If you worry that a virus

Will cause havoc in your iris,

If you fear to let coryza get a hold,

Just remember that the giants

Of the Hippocratic science

Have found virtue in the ordinary cold

If your thoughts are dark and chilly

At the mention of bacilli

And the specter that the common snuffle throws,

You are likely prejudicial—

Doctors find it beneficial

To possess at times a ruddy, running nose

For the irksome nasal thickness

Kills the bug of sleeping sickness,

Kicks the paralytic germ right in the pants,

So if you have infection

Of the mucus, it's protection,

You can have it—I prefer to take a chance!

Chicago Daily Tribune

BUT THE PUBLIC LIKE 'EM

Margaret Widdemer, the poetess, contributes to *The Saturday Review* the following rather caustic comments on "A Recent Form of Literature"

There ought to be a Bull or Proctor
To check these books about a Doctor

Doctors Galahad, Bradley, Roger,

The Doctor's Date, the Doctor's Lodger,

The Doctor's Villa, Buggy, Jungles,

(Oddly, never The Doctor Bungles)

The Doctor's Odysseys, Citadels,

The Doctor Silent, The Doctor Tells,

The Doctor Remembers, The Doctor Forgets,

The Doctor's Dog and his other pets,

The Doctor's Son, The Doctor's Wife,

The Doctor Looks at Love and Life

(They're all as noble as can be,

Not one of them would spit a fee

Or yank a passing tonsil out

Upon a merry sporting doubt

Or leave retractors in your tummy

Through lightheart haste to bridge or rummy.)

They're charming books—yes, that's quite clear—

But, Doctor, I've been sold the idea.

The one called "Doctor Here's Your Hat"—

Couldn't we leave the thing at that?

Diagnosis

CLINICOPATHOLOGICAL CONFERENCES

DEPARTMENTS OF MEDICINE AND PATHOLOGY, NEW YORK POST-GRADUATE MEDICAL SCHOOL AND HOSPITAL, COLUMBIA UNIVERSITY

Date February 18, 1941

Presiding Dr Irving S Wright

History

DR. MAURICE BRUGER This patient was a woman 50 years of age. Because of her incoherence, the history was obtained from her son.

Twenty years ago her left foot was amputated because of trauma. Three years ago she had a number of clay-colored stools. No detailed history of associated symptoms was obtained but at that time dyspnea was present on exertion. Blood chemical studies and gallbladder and gastrointestinal x-rays were negative at that time, but the electrocardiogram was reported as showing some evidence of myocardial damage. For the past five years she had subsisted largely on Coca-Cola and candy.

Seven days before hospitalization she suddenly became short of breath and complained of severe generalized pain. Rectal temperature was 104.6 F (40.4 C), pulse rate was 130 per minute, and the respiratory rate was 46 per minute. The family physician was consulted and a diagnosis of bronchopneumonia was made. Sulfapyridine (1.0 Gm. every four hours) was given, but no beneficial effects were noted after three days. Shortly thereafter it was discovered that the patient had taken the contents of three boxes of "Ex-Lax." On that day she became jaundiced and there was marked abdominal distention. Eight hours after the ingestion of the "Ex-Lax," a diarrhea developed. She also began to expectorate thick yellow sputum. Disorientation ensued which made hospitalization necessary.

On admission, the patient was found to be acutely ill, disoriented, and dyspneic. There was a moderate icterus of the scleras. Dehydration was apparent by loss of skin turgor. No petechiae were found. The pharynx was moderately injected. The lungs were clear throughout. The heart borders could not be accurately determined because of poor cooperation. There was a faint systolic murmur over the aortic area which was not transmitted. The pulse rate was 124 per minute and the blood pressure was 168/84 mm of mercury.

The abdomen was distended. The liver, spleen, and kidneys were not palpable. A 2 plus pitting edema of the hands and of the right foot was present. Tenderness of the calf muscles was elicited on pressure. Complete neurologic examination could not be performed because of lack of cooperation.

The urinalysis showed a trace of protein but no sugar or acetone. Microscopic examination revealed 2 to 3 red blood cells and 4 to 5 white blood cells per high-power field. No bile pigments were present in the urine. On admission, the blood urea nitrogen was 48.0 mg per hundred cubic centimeters, the nonprotein nitrogen 73.5 mg, with a urea ratio of 65 per cent. After the administration of fluids, the urea nitrogen and nonprotein nitrogen dropped to 22.0 mg and 49.0 mg per hundred cubic centimeters, respectively, with a urea ratio of 45 per cent. Total serum proteins were 5.4 Gm per hundred cubic centimeters, serum albumin, 2.1 Gm, and globulin, 3.3 Gm with an A/G ratio of 0.64. On admission the icteric index was 30. This increased to 44.6 after nine days. The van den Bergh test was strongly positive, both directly and indirectly. The serum cholesterol was 260 mg per hundred cubic centimeters, the cholesterol esters were 80 mg, and the ester ratio was 31 per cent. The hemoglobin fell from 13.6 Gm on admission to 9.7 Gm on the tenth hospital day. During this time the patient received approximately 5 Gm of sulfathiazole daily. (The free blood sulfathiazole was 8.9 mg per hundred cubic centimeters.) The white blood count fluctuated between 29,000 and 10,000, with an average neutrophilia of 85 per cent. Diagnostic agglutinin studies for typhoid, paratyphoid, and undulant fever were negative. The electrocardiogram showed a sinus tachycardia and a slight depression of ST₁ and ST₂. The T waves were isoelectric in all four leads. The report of a blood culture was not available until after the death of the patient.

After hospitalization the patient ran a septic type of temperature ranging from 99 F (37.2 C) to 103 F (39.4 C). The respiratory rate was increased to about 26 per minute. For the

first four days there were changes in the physical findings in the chest. These consisted of rales and rhonchi in both lung fields, but no dullness was present. Examination of the sputum revealed no pneumococci after mouse inoculation, but a few colonies of hemolytic streptococci were isolated. The administration of sulfathiazole led to a slight reduction in temperature. A portable x-ray of the chest showed an infiltration of the left lower lobe with generalized congestion in the balance of the lung fields. On the sixth day of hospitalization the icterus had apparently disappeared to a large degree. Transfusions were given because of a progressive anemia. On the eighth day of hospitalization the patient suddenly became markedly cyanotic and dyspneic. The pulse rate was 130 per minute and the quality thready. There were numerous moist rales heard over the left base posteriorly. A loud pleural friction rub was palpable and audible over the entire right chest. Twenty-four hours later the friction rub disappeared. The patient gradually weakened and died on the twelfth hospital day.

Discussion

DR IRVING S. WRIGHT: This case is presented as a clinical diagnostic problem so Dr Duryee, who is to open the discussion, has no information regarding the pathologic findings. These will be presented later.

DR A. WILBUR DURYEE: There appear to be several possible solutions to this diagnostic problem. Certain things, however, are outstanding, and in analyzing this case we must discuss these points. In the past history and available laboratory findings an outstanding feature was the inadequate diet, and one wonders what bearing this had on the whole picture. Apparently her diet was deficient in vitamins, and a history of avitaminosis can be established. The second noteworthy point in her past history is that there must have been some pathology in the region of the liver, pancreas, or gallbladder because of the history of clay-colored stools. There is some evidence to indicate that cardiac disease was present.

The outstanding points in the acute illness are the acute onset, jaundice, the orthopnea, tachycardia, septic temperature, and the steady decline over a period of twenty-two days. The effect of sulfathiazole and phenolphthalein on the course of the illness should also be considered.

In the course of the disease the interesting findings that we must consider are (1) the mental signs, (2) the high icteric indices, (3)

the septic temperature, (4) the abdominal distention, (5) the edema, not only of the lower extremities but also of the upper extremities, (6) the hematuria, (7) the nitrogen retention, and (8) the progressive anemia. I should like to discuss each one of these points and outline the various possibilities that may account for these findings.

The mental signs may be toxic, chemical, or infectious in nature or they may be secondary to a cerebral accident. The icterus may be accounted for by either of the two drugs given. It may be on a toxic basis or due to an obstruction of the biliary flow or chronic passive congestion. The distention remained through the entire course and may be due to pathology in the pancreas. Apparently there was no intestinal obstruction. The edema can be explained on the basis of the inverted albumin/globulin ratio and the poor nutritional history. In the kidney picture there is insufficient evidence to give one an idea of true nephrosis, although the possibility of a glomerulonephritis with a large nephrotic component must be considered. The low specific gravity and the red blood cells in the urine are significant. The hematuria may be due to the sulfathiazole, chronic passive congestion, or nephritis. The septic temperature is something that cannot be overlooked, and in my opinion we are dealing with an acute infection although the focus is not immediately apparent. The cerebral findings are insufficient to explain the picture. Perhaps pathology in the pancreas, liver, or gallbladder is responsible. It does not look like a purely renal affair because of the type of acute onset. Two important organs remaining are the lungs and the heart. The outside physician made a diagnosis of bronchopneumonia. The heart seems to me to be the most logical site for the infection. In view of the past findings, there may be a cardiac lesion with a superimposed staphylococcal infection. The differential diagnoses may be outlined as follows:

1. Endocarditis, probably staphylococcal because of the acute form, the extremely high temperature, and the improvement in her general picture when sulfathiazole was administered. The leukocytosis dropped from 29,000 to 10,000, and there was a general tendency to improve although there was a flare-up later. The cerebral symptoms may be explained by the fever or toxicity from the whole infection.

It is hard to explain the amount of icterus she had on a purely cardiac infectious basis unless she had an embolic obstructive lesion.

in the liver That is one item that does not fit the picture very well

There are several questions I should like to ask. Did she develop any petechiae? What did the blood culture show? And did she develop an enlarged spleen or any acute abdominal condition?

2 Although the acute onset and the generalized systemic reaction make it doubtful, we should add to our diagnostic list one or more of the triad of acute pancreatitis, cholecystitis, and liver abscess

3 The third diagnosis, because of the lung picture, is bronchopneumonia, but I believe in this case it was terminal The pleurisy heard may have been secondary to the bronchopneumonia The secondary anemia could have resulted from the sulfathiazole or from the infection

4. In addition, she had another condition—avitaminosis There was a low protein intake which would account for the inverted A/G ratio

5 She also had generalized arteriosclerosis with hypertension

These seem to me the most logical diagnoses One other possibility may be a neoplasm of the lung which grew slowly on the left side but suddenly blocked the bronchus, giving an acute atelectasis, but this does not sound plausible

Dr Duryee's Clinical Diagnoses

1 Acute bacterial endocarditis, probably staphylococci

2 Hypertensive cardiovascular disease

3 Bronchopneumonia

4 Avitaminosis

Dr WRIGHT Before we proceed to Dr Richter, are there any physicians here who would like to add to the diagnostic list?

Dr TERESA MCGOVERN This case presents many of the features seen in some of the patients at Welfare Hospital with generalized vascular lesions Both periarteritis nodosa and disseminated lupus may well be added

Dr. MILTON B ROSENBLATT Pyelonephritis

Dr ALFRED LILIENFELD Suppurative thrombophlebitis, with liver abscess

Dr WRIGHT Does anyone here know whether phenolphthalein and the sulfonamide group are more toxic when used together than when used separately?

Dr HERBERT K ENSWORTH So far as we know the sulfonamides can be given with any other medication

Dr WRIGHT Dr Bruger, will you please

answer the three questions Dr Duryee asked?

Dr BRUGER The patient did not develop any petechiae Frequent examination failed to reveal enlargement of the spleen The blood culture done on December 2 showed streptococci with a narrow zone of incomplete hemolysis Eight hundred and thirty-six colonies were counted in one plate

Pathology

Dr MAURICE N RICHTER The principal lesion is acute bacterial endocarditis of the aortic valve There are no other important findings in the heart There is no underlying valvular lesion of any type, and the valve cusps were normally formed The liver showed some rather curious yellowish areas on the cut surface but they could not be interpreted on gross examination The spleen was enlarged, weighed 490 Gm, and was somewhat softer than usual The kidneys were not abnormal on gross examination The gallbladder showed nothing of interest

Sections of the vegetation of the aortic valve show a leukocytic and fibrinous exudate, with bacterial colonies along the edge of the vegetation These organisms are gram-positive Some of these colonies are extremely large These findings are typical of acute bacterial endocarditis In the heart there are a few small areas of acute focal myocarditis The kidneys have small infarcts, and one section shows a blood vessel that is completely blocked by an embolus There are no lesions in the glomeruli themselves such as are usually seen in subacute bacterial endocarditis The sections of the liver are interesting because they show an extensive central necrosis Occasionally, one sees small bile ducts adjacent to these necrotic areas with leukocytes in the lumen and infiltration around the ducts This liver condition is found in many cases of infection and is not specific for any one type of organism or lesion It is somewhat more extensive in this case than is ordinarily seen

Pathologic Diagnoses

Acute bacterial endocarditis of aortic valve
Bacteremia with metastases (Streptococcus hemolyticus)

Infarction of kidney

Central necroses of liver

Acute cholangiolitis and pericholangiolitis

Jaundice

Lobular pneumonia

Acute fibrinous pleurisy

Acute splenic tumor

DR WRIGHT I think that since Dr Duryee had no previous knowledge of the case and it was a difficult diagnosis to make he should be congratulated

DR BRUGER Were there any areas of infarction in the lung?

DR RICHTER No, there were not

DR ENSWORTH Was there any evidence of where this infection entered the blood stream?

DR RICHTER No, there was no evidence

DR WRIGHT Was the growth on the aortic valve of long standing or rather recent in development?

DR RICHTER I think comparatively recent, but I cannot place it within the three weeks

DR WRIGHT Was there evidence of old

scarring of the valve in addition to the recent involvement?

DR RICHTER No, I think that the lesion was a recent one and the underlying valve did not show any particular change

DR BRUGER William Osler was unusually interested in this disease and he frequently stressed in his writings that attacks of orthopnea and dyspnea may be among the earliest symptoms in acute endocarditis

MEDICINE NOT A BUSINESS

Most of the differences between laymen and the medical profession result from a lack of understanding, Dr Frank H Lahey, president-elect of the American Medical Association and director of the Lahey Clinic in Boston, told an audience of more than 800 persons in the memorial chapel of Union College on March 13, as reported in the Schenectady *Gazette*. Dr Lahey spoke under the auspices of the Steinmetz Memorial Foundation and his talk was the fourteenth in the series of annual lectures presented in honor of Charles Proteus Steinmetz.

Most laymen, Dr Lahey explained, take a business man's approach toward medicine. This he termed "a misunderstanding of motives." "Business," he said, "deals with commodities. Medicine is never a commodity and the doctor never thinks of himself as a commodity. Business deals with money and goods. Medicine deals with knowledge."

Because medicine is concerned with "qualitative competition," the medical profession is necessarily timid about new ideas that would change it radically, Dr Lahey said. Addressing himself to those persons who urge socialized, regimented medicine, Dr Lahey pointed out that "America stands highest in medicine, and that for many years, the tide has been toward America. Where they have had regimented,

socialized medicine the standard has been lower."

The American Medical Association and its members want to see "evolved changes," according to the speaker. "Medicine is cautious," he said, "maybe a little stiff-necked to see changes made patiently."

Using as an example the demand to have medical insurance, Dr Lahey explained that the association of doctors would approve of such a move providing it fulfilled three conditions. Such insurance, he said, would "first have to be under the commissioner of insurance so that it would be financially sound. Second, it should be limited by some top salary so that it would not be given where it was not needed. Third, and most important, there would have to be a free choice of doctors." Unless these three conditions were fulfilled, said the lecturer, this movement would be opposed. "You must," he added, "have a free choice of a doctor even if you choose a bad one."

Since the layman is dependent on medicine, Dr Lahey declared, it is necessary that the layman know the medical profession's point of view. In giving a résumé of the work done by the American Medical Association, to whose presidency he will be inducted in June, the lecturer termed it as "an attempt to organize medicine so that it will work."

ATTENTION P AND S

The annual A.M.A. dinner for alumni of the College of Physicians and Surgeons of Columbia University, will be held at the Hotel Statler, Cleveland, Ohio, on Wednesday, June 4, at 7 00 P.M. The local Committee on Arrangements is Dr Gerald H Shibley and Dr Valentine Jordan.

THY BROTHER'S KEEPER

Every malpractice action undermines the confidence of the public in all physicians, and it is said that a dozen new suits are commenced based upon the publicity of a new case. You are your brother's keeper in maintaining a justified public confidence. Let no improper act of yours lead to a betrayal of that trust.—*Wisconsin Med J*

Abstracts of Proceedings of the

NEW YORK PATHOLOGICAL SOCIETY

The NEW YORK STATE JOURNAL OF MEDICINE announces that under arrangement with Dr Francis Carter Wood there will appear in this Section abstracts of the proceedings of the regular meetings of the New York Pathological Society —EDITOR

REGULAR MEETING, NOVEMBER 28 1940

MAURICE N RICHTER, *President*

D MURRAY ANGEVINE, *Secretary*

Postpartum Necrosis of the Pituitary Gland Dr Alfred Plaut

Baffling discrepancies between clinical phenomena and anatomic findings mar our understanding of diseases connected with the pituitary gland. This becomes evident when one reads about Simmonds' disease, pituitary cachexia, anorexia nervosa, postpartum weight loss, etc. For one group of cases, at least, an anatomic and etiologic basis has been provided by Sheehan (Sheehan, H S. *J Pathol & Bact* 45: 189, 1937). According to Sheehan, Simmonds' disease, severe or mild, is caused in most instances by postpartum necrosis of the anterior lobe. The anterior lobe becomes necrotic when the patient goes into shock from severe hemorrhage. American literature on this subject is scant; the mechanism of the necrosis is not clear.

The following case is, therefore, presented.

A. S. (A-34-40). The patient was a 21-year-old primigravida, with normal findings on prenatal care. Three days before labor pains started, she became ill with a cold and remained in bed, from that time on she had a fever.

On admission the temperature was 104 F and the pulse 130, there was herpes labialis and a diffuse punctate, macular, partly scarlatiniform rash over the trunk and face. The throat was injected. The blood count and sternal puncture revealed acute stem-cell leukemia, the count showing a hemoglobin of 50 per cent, 2,520,000 red blood cells, with a leukocyte count around 1,000 and 80,000 platelets. The urine was normal. The blood culture contained large numbers of colonies of hemolytic streptococcus.

The patient delivered spontaneously. The infant was normal except for a rash similar to that of the mother. The infant developed normally later. During delivery the patient lost about 1,200 cc of blood and went into

profound shock. She died with hyperpyrexia two days later.

At autopsy (aside from the anatomic manifestations of leukemia) a deep cervical tear was found. The hypophysis appeared large in relation to the sella, the anterior lobe, near the base of the stalk, formed a round bulge. The cut surfaces of the anterior lobe suggested diffuse necrosis. They were homogeneous, light brownish yellow, and velvety, entirely devoid of detail, the hilar connective tissue could not be seen. Narrow zones under the capsule appeared reddish (see Fig 1).

The microscopic picture confirmed the gross diagnosis. Most of the tissue of the anterior lobe showed incomplete necrosis, with severe destruction of cell bodies and varying destruction of nuclei. Well-preserved anterior lobe tissue, partly with recognizable pregnancy change, was found near the intermediate region and under the capsule. Some of this tissue was separated from the necrotic area by a narrow zone of hyperemia and hemorrhage. The posterior lobe appeared normal and so were the epithelial cells it contained.

In all probability this patient, had she survived, would have become a victim of Simmonds' disease.

While we know that embolization is not the cause of pituitary necrosis, we still do not know what actually causes it. The lesion resembles infarction, in the neighborhood of the capsule and other adjoining structures the tissue may escape the necrotizing process, just as in a kidney infarct. But there is no embolic or thrombotic occlusion of a correspondingly large vessel, and the thromboses that sometimes are found probably are secondary to the necrosis. The sudden decrease in blood flow as caused by severe loss of blood and by shock, combined with the assumed vulnerability of the tissue of the anterior lobe

FIG 1 Gross picture of pituitary gland after formalin fixation. The cut surfaces of the anterior lobe are homogeneous and velvety. No detail is visible. The narrow black markings at the periphery and near the intermediate region correspond to preserved anterior lobe tissue.

in pregnant women seems to represent the causative mechanism. Postpartum necrosis has been observed after shock with only negligible hemorrhage (Sheehan, H. L., and Murdoch, R. *J. Obst. & Gynaec., Brit. Emp.* 45: 456-489, June, 1938—Case II, for instance). Thus, the blood loss cannot be the directly determining factor. The fact that pituitary necrosis does not occur in men, even after most severe hemorrhage and profound shock, points to the pituitary of the pregnant woman as a *locus minoris resistentiae*. The weakness might be inherent in the pregnancy change of the chief cells. It might be ascribed in part to the enlargement of the anterior lobe which is squeezed in the, now too narrow, sella. In one case (Gottschalk, H. C., and Tilden, J. L. *J. A. M. A.* 114: 33, 1940) part of the anterior lobe which protruded from the sella was spared. Such a finding speaks in favor of a mechanical factor.

Shock can cause necrosis in other organs (intestine and kidney). As the experiments of Penner and Bernheim (Penner, Abraham, and Bernheim, Alice Ida. *Arch. Path.* 30: 465, 1940) prove, kidney necrosis in shock is caused by vasospasm, and according to Moon "the arteries of animals in shock are in a state of maximal contraction." Little if anything is known about the reactivity of pituitary arterioles and arteries. Even the anatomic arrangement of the hypophyseal

blood supply is still under debate and, with it, the possibility of shunts.

Pending further investigations, I propose the working hypothesis that vasospasm, which is part of the shock syndrome, is an essential factor in bringing on postpartum necrosis of the anterior pituitary. A similar hint has been made by Giornelli (Giornelli, L. *Riv. ital. di ginec.* 14: 533, 1933).

Discussion

DR JOSEPH VICTOR (by invitation). I should like to ask Dr. Plaut what basis there is for assuming that this is a postpartum change. Might not this change have occurred or started before delivery?

DR D. MURRAY ANGEVINE. About two years ago Dr. Harrar of the Department of Obstetrics and Gynecology at the New York Hospital asked me if we ever found the changes described by Sheehan in cases dead from obstetric shock—namely, necrosis of the pituitary, subendocardial hemorrhages, and areas of hemorrhage in the lungs. I went over our autopsied cases at that time. In the pituitaries examined, about 10 I believe, there was only 1 with necrosis, and it was not so extensive as that just described. I should like to ask Dr. Plaut if he feels that the necrosis is definitely associated with pregnancy. None of the other changes that Sheehan described were present.

DR MAURICE N. RICHTER. I assume that in this case the blood vessels were examined for evidence of leukemic thrombosis, since this is a case of leukemia the question might arise whether the changes in the pituitary were related to the leukemia rather than to the pregnancy.

DR ALFRED PLAUT. Such an extent of necrosis of the anterior lobe of the pituitary is not compatible with normal life. The patient was in good health until three days before admission when she contracted what she thought was a cold, it was perhaps the onset of her acute leukemia.

A large number of such lesions have been described postpartum and none antepartum. I do not see why we should assume just in this particular case that the causation should be different from other cases.

DR VICTOR. The reason I asked is because of some experimental data that were obtained a few years ago in studying the metabolism of the pituitary in different phases of reproduction. It was found that the metabolism of the pituitary at the time of parturition was about three times as high as in any other

phase of reproduction in the rat. These reproductive phases included postpartum changes, changes in the estrus cycle, and so on, so that there is some physiologic evidence that the anterior lobe of the pituitary is extraordinarily active before parturition, and it seems to me the reasons presented with regard to the postpartum part of this lesion might just as well be assumed for an antepartum origin, simply because the patient was well before parturition and died forty hours after.

DR PLAUT: Why should leukemia lead to necrosis of the pituitary? To my knowledge no pregnant woman who died of anything but shock and hemorrhage ever presented this picture.

In regard to the second point, in the dis-

cussion of Dr Angevine, I should like to ask how long after the severe shock did these patients die. One cannot expect the necrosis to develop in a few hours.

DR ANGEVINE: A good many lived for as long as two days.

DR PLAUT: That means that some might have lived for a few hours only. There are in the American literature 2 cases of this disease. Dr Stander, years ago while still in Baltimore, wrote a paper in which he mentioned 2 patients who died after hemorrhage and shock during delivery and who had pituitary necrosis, but nobody at that time paid much attention to this lesion.

In reply to Dr Richter's question, there were no thromboses that could explain the diffuse necrosis.

An Experimental Study of Nutrition and Age as Factors in the Pathogenesis of Common Diseases of the Rat. Dr John A. Saxton, Jr. (*by invitation*)

A study was made of the most common spontaneous diseases in over 300 rats of the Yale strain used in two experiments by C. M. McCay dealing with the relation of diet to the average life span. The purpose was to determine the relation of these diseases to age and to diets altering the average life span. The study included rats killed at intervals during the experiments and those dying naturally.

In the first experiment the effects of protein level (35 per cent and 8 per cent), type of protein (liver and casein), and slight restriction of diet after middle age were studied. The average life span on a high casein, unrestricted diet was significantly shorter than on a low liver, slightly restricted diet. The second experiment dealt with the effects of retardation of growth by a greatly restricted but high quality diet, started immediately after weaning. This experiment had run 600 days at the time of the report, but similar previous experiments have shown that rats thus retarded in growth may have greatly extended life spans (McCay, C. M., *et al.* *J. Nutrition* 18: 1, 1939).

The most common disease was a characteristic bronchopneumonia of obscure etiology leading to bronchial obstruction and bronchiectasis in affected lobes. This disease increased in frequency with age, from rare examples at 200 days to over 80 per cent at 600 days. The development of bronchial lymphoid tissue and changes in the distensibility of the lungs with age appeared to be factors favoring bronchial obstruction and bronchiectasis. The disease was not influenced by the

variables of the first experiment but was retarded both in age incidence and severity in rats retarded in growth.

The second most common disease was a degeneration of the kidneys characterized by albuminuria and progressive obstruction of the renal units by hyaline casts with subsequent fibrosis. There was an increasing frequency with age from 9 per cent at 300 days to 54 per cent in rats over 700 days old. In the first experiment the high casein, unrestricted diet, which shortened the average life span, favored development of the disease (100 per cent of 13 rats) as contrasted with a low liver, slightly restricted diet (26 per cent of 19 rats). The disease was not seen in rats retarded in growth up to 600 days but was present in several controls of corresponding age.

Malignant tumors of various types, most commonly lymphosarcomas arising within the lungs, showed an increase in incidence with age in the first experiment from 18 per cent at 500 days to 32 per cent in rats over 700 days old, with no relation to the variables of this experiment. In the second experiment no tumor was found in rats retarded in growth up to 600 days as contrasted with 18 examples in the controls of corresponding age. Chromophobic adenomas of the pituitary were common in control rats of over 450 days of age, but none was seen in the retarded rats up to 600 days.

Vascular lesions similar to human atherosclerosis were not seen in any animals examined.

It is concluded that there are several com-

FIG 1 Gross picture of pituitary gland after formalin fixation. The cut surfaces of the anterior lobe are homogeneous and velvety. No detail is visible. The narrow black markings at the periphery and near the intermediate region correspond to preserved anterior lobe tissue.

in pregnant women seems to represent the causative mechanism. Postpartum necrosis has been observed after shock with only negligible hemorrhage (Sheehan, H L, and Murdoch, R. *J Obst & Gynaec, Brit Emp* 45: 456-489, June, 1938—Case II, for instance). Thus, the blood loss cannot be the directly determining factor. The fact that pituitary necrosis does not occur in men, even after most severe hemorrhage and profound shock, points to the pituitary of the pregnant woman as a *locus minoris resistentiae*. The weakness might be inherent in the pregnancy change of the chief cells. It might be ascribed in part to the enlargement of the anterior lobe which is squeezed in the, now too narrow, sella. In one case (Gottschalk, H C, and Tilden, J L. *J A M A* 114: 33, 1940) part of the anterior lobe which protruded from the sella was spared. Such a finding speaks in favor of a mechanical factor.

Shock can cause necrosis in other organs (intestine and kidney). As the experiments of Penner and Bernheim (Penner, Abraham, and Bernheim, Alice Ida. *Arch Path* 30: 465, 1940) prove, kidney necrosis in shock is caused by vasospasm, and according to Moon "the arteries of animals in shock are in a state of maximal contraction." Little if anything is known about the reactivity of pituitary arterioles and arteries. Even the anatomic arrangement of the hypophyseal

blood supply is still under debate and, with it, the possibility of shunts.

Pending further investigations, I propose the working hypothesis that vasospasm, which is part of the shock syndrome, is an essential factor in bringing on postpartum necrosis of the anterior pituitary. A similar hint has been made by Giornelli (Giornelli, L. *Riv ital di gynec* 14: 533, 1933).

Discussion

DR JOSEPH VICTOR (by invitation). I should like to ask Dr Plaut what basis there is for assuming that this is a postpartum change. Might not this change have occurred or started before delivery?

DR D MURRAY ANGEVINE. About two years ago Dr Harrar of the Department of Obstetrics and Gynecology at the New York Hospital asked me if we ever found the changes described by Sheehan in cases dead from obstetric shock—namely, necrosis of the pituitary, subendocardial hemorrhages, and areas of hemorrhage in the lungs. I went over our autopsied cases at that time. In the pituitaries examined, about 10 I believe, there was only 1 with necrosis, and it was not so extensive as that just described. I should like to ask Dr Plaut if he feels that the necrosis is definitely associated with pregnancy. None of the other changes that Sheehan described were present.

DR MAURICE N RICHTER. I assume that in this case the blood vessels were examined for evidence of leukemic thrombosis, since this is a case of leukemia the question might arise whether the changes in the pituitary were related to the leukemia rather than to the pregnancy.

DR ALFRED PLAUT. Such an extent of necrosis of the anterior lobe of the pituitary is not compatible with normal life. The patient was in good health until three days before admission when she contracted what she thought was a cold, it was perhaps the onset of her acute leukemia.

A large number of such lesions have been described postpartum and none antepartum. I do not see why we should assume just in this particular case that the causation should be different from other cases.

DR VICTOR. The reason I asked is because of some experimental data that were obtained a few years ago in studying the metabolism of the pituitary in different phases of reproduction. It was found that the metabolism of the pituitary at the time of parturition was about three times as high as in any other

of view of its application to diagnosis and prognosis and from the point of view of its application to therapy. No fundamental change has occurred in the relationship of bacteriologic information to the diagnosis and prognosis of pneumonia. Observations in the Department of Health's Pneumonia Control Division stations indicate that changes in the results of bacteriologic examinations that can be ascribed to sulfonamide therapy are generally small and become significant only in cases receiving large amounts of drug.

When the results of the examination of specimens from patients receiving 10 Gm. or more of sulfapyridine or sulfathiazole are considered, the recovery of pneumococci from sputum specimens appears to be less than the 1939 average of 68 per cent. In 44 specimens obtained from such patients, only 2 showed pneumococci on Neufeld examination, and 19 showed pneumococci on mouse inoculation or blood agar plate examination—a total of 21 positive results, or 48 per cent, of the specimens examined. Pneumococcus classification has been extended to include 24 more pneumococcus strains and their interrelationships recognized by Kauffman, *et al.*, and Walter, *et al.*, which, together with the 31 now in use, make a total of 55.

Important changes have occurred in regard to the relationship of bacteriologic examinations to therapy. Such changes do not now make it possible to omit bacteriologic examinations entirely, however, and, in fact, the best medical practice continues to include prompt and early determination of pneumococcus types and other microorganisms, such as beta hemolytic streptococci, Friedländer bacilli, and staphylococci. The place of serum therapy among the other curative agents relies primarily on the judgment of the prac-

ticing physician as to the need for an additional therapeutic agent, to be employed when chemotherapy is not available because of toxic actions or when it is not effective. Since such need may develop during the course of treatment of any patient, a bacteriologic examination to indicate the kind of serum to be used is advisable early in the course of the disease or at an emergency at the time the need is recognized.

The recognition of bacteria that are resistant to the action of sulfonamide drugs may become a useful indication for the use of type specific antipneumococcus serum, and methods are now in use that may aid in making this a practical reality. Three strains that are resistant to 5 mg. per hundred cubic centimeter concentration of sulfapyridine in solid media have been isolated from 3 different patients.

In each case resistance to the bacteriostatic action of sulfapyridine was correlated with an unsatisfactory response of the patient to sulfapyridine therapy. Such sulfapyridine-resistant microorganisms remain susceptible to the action of type-specific antipneumococcus serum. Although resistance to the bacteriostasis of sulfonamide drugs is not at present a frequent observation among pneumonia patients coming to the attention of the Pneumonia Control Division, it should be suspected when favorable therapeutic results are not obtained, and appropriate bacteriologic examinations should be carried out.

In 1938 over 6,000 specimens from pneumonia patients were examined by the Department of Health, in 1939 over 9,000, and in 1940 6,452. Many physicians find bacteriologic examinations for pneumonia patients of value while using chemotherapy as the preferred therapeutic agent in every pneumonia case.

"DEARTH" OF COUNTRY DOCTORS

"At present there is much agitation about the dearth of rural physicians. This need is much exaggerated. Our survey of this state does not show any great shortage of rural physicians. There are some isolated, sparsely populated areas in the northern part of the state in which physicians are widely separated. The few people who reside in these areas must expect to travel some distance for medical care. Even with government subsidy it would not be feasible to establish first-class medical care close to these people. Our investigation has shown that it is not so much lack of medical care in these districts as it is indifference or lack of education on

the part of certain groups. Physicians within reach have never refused to go many miles to see these patients or give them adequate care, even with no prospects of financial return. The State Medical Association not long ago requested, through the newspapers throughout the state, information regarding those who had been unable to obtain adequate medical care. About 200 replies were received. These replies showed definitely that these people could not be satisfied or that they did not know how to avail themselves of the medical care provided for them."

—J. M. Hayes, M.D., Minneapolis

mon spontaneous diseases of rats which increase in incidence with age, sufficiently to become limiting factors in the average life span. Diets may affect the average life span through their influence upon certain of these diseases. Retardation of growth by drastic restriction of diet retards the development of common spontaneous diseases along with body size, suggesting that adult structure and function play a role in the development of these diseases.

Discussion

DR PAUL KLEMPERER Sproul and Wilens described periarteritis in a certain percentage of aged rats, while Dr Saxton mentioned only medial changes and calcification. Does this mean that you never found those changes described by Sproul and Wilens? Is this breed of rats considered representative for all other strains, or is it possible that the strain that Sproul and Wilens were working with was different?

DR RICHTER Wilens and Sproul (Wilens and Sproul *Am J Path* 14 177, 201, 1938) worked with rats in Sherman's laboratory. The influence of diet in the strain had been previously reported by Sherman and Campbell (Sherman, H C, and Campbell, H L *J Nutrition* 2 415, 1930).

DR PLAUT Do these two main lesions, those of the kidney and lung, occur in rats other than laboratory strains?

DR VICTOR Have you observed cirrhosis of the liver in any of these rats?

DR J MURRAY STEELE I was not quite clear as to whether the renal lesion was less affected by retardation of growth than the lung lesion, if that is true, that seems to be an interesting difference between them. I should like to hear more about that.

DR JOHN A. SAXTON, JR We have seen a few examples of the periarteritis described by Wilens and Sproul, but I did not include it in the report because it has not been seen frequently enough to be a factor in determining the average life span. We have found with that condition a rather severe vascular nephritis and had the opportunity to study one animal during life. The phenolsulphone-

phthalein excretion was 5 per cent and the blood urea nitrogen was elevated. It died apparently in uremia.

Concerning breed differences, I do not think that the diseases described are necessarily peculiar to the Yale strain, but since there are known differences in length of life in different breeds, differences in incidence might be expected. The laboratory conditions may also be a factor. So far as I know there has not been sufficient study on the length of life in relation to spontaneous changes to make possible a statement on incidence in other breeds.

The kidney and lung diseases are present in practically all strains of rats maintained in laboratories. The lung disease has been found in wild rats, although there are no available statistics on frequency. I have seen no reference to the kidney disease in wild rats.

I have seen only one example of spontaneous cirrhosis of the liver. It is apparently rare in the strains that I have examined.

In regard to the relation of retardation to the development of this renal disease, we have not seen examples of it in the retarded animals, but several cases have appeared in the controls. Routine urinalyses have shown that the retarded rats have not been excreting albumin, whereas many of the controls, particularly those receiving a protein supplement, have had albumin in the urine. Thus far the renal lesion appears to have been more affected by retardation than the lung lesion.

DR VICTOR Have you any evidence of renal disease resulting in death—the human nephrosis with edema?

DR SAXTON Of the animals studied during life which have subsequently been shown to have the renal disease, none has had an elevated blood urea nitrogen. The evidence that the renal disease may result in death is based upon the microscopic picture of extensive renal damage.

DR KLEMPERER Is there any relation between cardiac hypertrophy and renal disease?

DR SAXTON, JR We have usually found a slightly enlarged heart in rats showing an advanced stage of this renal disease.

Relationship of Bacteriologic Procedures to the Diagnosis and Therapy of Pneumonia

Dr Wheelan D Suthiff, Assistant Director (Pneumonia) Bureau of Laboratories, New York City Department of Health

As chemotherapy with sulfonamide drugs is now the therapy of choice for the treatment of pneumococcus and beta hemolytic strepto-

coccus pneumonia, the relationship of bacteriologic procedures to the care of pneumonia patients must be re-examined from the point

of Medicine, Medical Society of the County of Queens, Utica Academy of Medicine, National Health Library, Westchester Free Medical Library, Schenectady Medical Library Association

The state libraries are New York State Library, Medical Library, Psychiatric Institute, Hudson River State Hospital, Poughkeepsie, Craig Colony, Sonvea, Institute for Malignant Diseases, Buffalo

The city and county libraries are Grosvenor Library, Buffalo, Municipal Reference Library, Public Health Division, New York City, Bureau of Laboratories, New York City, Edward J Meyer Memorial Hospital, Buffalo, Bellevue Hospital, Laboratories of Pathology, Bellevue School of Nursing, New York City, and Grasslands Hospital, Valhalla

Foundation libraries are Rockefeller Institute for Medical Research, Lawrason Brown Library, Trudeau, Saranac Laboratory, and Mary I Bassett Hospital, Coopers-town

Medical school libraries are Columbia University Medical School (P & S), University of Rochester Medical School, University of Buffalo Medical School, New York University, College of Medicine, Cornell University Medical School, Syracuse University Medical School, New York Post-Graduate Medical School, Long Island College of Medicine, and Prentiss Library, New York Medical College

Memorial libraries are William Ropes May Library, New York City, and Charles S Wilson Library, Johnson City

Sanitarium and infirmary libraries are Clifton Springs Sanitarium, Metropolitan Life Insurance Hospital, Mt McGregor, and New York Eye and Ear Infirmary

The hospital libraries are Montefiore Hospital, New York City, Mount Sinai Hospital, New York City, New York Hospital, Westchester Division, White Plains, John M Wheeler, Presbyterian Hospital, Hospital for Ruptured and Crippled, New York City, St Vincent's Hospital, New York City, Lenox Hill Hospital, New York City, Lebanon Hospital, Bronx, Metropolitan Hospital, Welfare Island, and New York Orthopedic Dispensary

This classification is arbitrarily arranged according to questionnaires. Therefore, the selection may not be as the staffs of the library would have chosen

According to Dr Lawrence's comprehensive report,² there are 316 general and 305

miscellaneous hospitals in the state. Most of them were omitted in this survey because their libraries are not included in the A M A Directory

The oldest libraries are not necessarily the largest libraries. It is difficult to determine the exact age of libraries, as usually they had their beginning in a gift of old books, with other gifts added gradually. The New York Hospital Library in White Plains is among these old institutions, having been established in 1821. The Medical Society of the County of Kings was organized in 1844, The New York Academy of Medicine, in 1847, the Clifton Springs Sanitarium, in 1850, the Hudson River State Hospital in Poughkeepsie, in 1871, and the Syracuse University Library, in 1872

One of the most interesting facts shown in this survey concerns the use of books and journals in each library. Use depends not only upon the number of readers making use of its facility but also upon the type of material on the shelves. Some of the larger libraries are depositories for medical literature, old and modern, good and poor, and for that reason there will be much material that has infrequent use. Again, some of the smaller libraries clear out old medical books and journals regularly and, therefore, volumes on their shelves are more frequently read. These factors may have affected to some degree the figures shown in Table 2

Use of the 2 larger libraries in Buffalo is notable when compared with the number of volumes in these institutions. The Grosvenor Library is a city-supported general library with an annual circulation of 240,000 volumes, circulating 33,125 volumes or 14 per cent of the whole. Total attendance is 180,000, 11 per cent being in the medical department. The University of Buffalo Medical Library has 28,855 volumes, with an annual circulation of 41,875 volumes and 35,000 readers. This heavy use of books seems to be true of a few other libraries according to the survey, but in these libraries there is extensive use of unbound material not accounted as volumes

The survey also indicates the number of employees in each library. The number naturally depends both upon size of the library and upon use of the volumes. This fact is indicated in Table 3

While the work load seems to be from 1,000 to 10,000 volumes per employee, with an average of 4,000, it must be remembered that the librarian in a medical society library has many additional duties besides those of caring

Special Article

MEDICAL LIBRARIES IN THE STATE OF NEW YORK

FLORENCE A COOKSLEY, M A , Rochester, New York

A SURVEY of medical library facilities in the State of New York was undertaken to determine (1) what is offered in medical literature to the physicians in the large cities and in smaller communities, (2) where these medical libraries are situated, and (3) what provision is made for the practitioner located at some distance from a medical library. A questionnaire was sent to all medical libraries of the state listed in the *Directory of the American Medical Association* and a few others not included in that list but which are members of the American Library Association. Fifty-two questionnaires were sent out and forty-eight were returned. Except for the Albany Medical School Library, those failing to make returns were among the smaller libraries.

The oldest libraries, it was found, are those attached, first, to medical societies and, second, to medical schools. There are many small hospital libraries, recently developed since the recommendations of the American Medical Association¹ regarding the adequate hospital library. The Association defined what it considers essential in a hospital undertaking an educational function and states that minimum needs are "a useful selection of late editions of standard text and reference books and current files of not less than ten of the better medical journals."

Many hospitals gradually acquire a considerable library through gifts of books from retired physicians or from their estates after their death. Many physicians "clean house" by dumping old textbooks into a medical library and it is a good practice as long as the collection is augmented by modern books and journals. The recommendations of the A M A led many hospitals to weed out much of their accumulation of old books and to fill the emptied shelves with recent works and, instead of depending upon physicians to bring in their dog-eared journals, have subscribed to one or two publications in each field of medical practice. Full-time or part-time librarians have been employed in these hospitals, or the record librarians have taken over the care of the library.

¹Librarian, Rochester Academy of Medicine

In New York State a special effort has been made to meet these requirements of the A. M. A. and, although hospital libraries are planned for the use of interns and residents, members of the staffs find the book shelves convenient while visiting the hospitals. It is because of the growth of hospital libraries that the number of medical libraries in the state seems extensive.

Medical libraries may be grouped in two ways: first, according to size, that is, number of volumes, and, second, according to type—whether they are medical school libraries, medical society libraries, state libraries, hospital libraries, or those established by foundations or by sanitariums.

There are 8 large medical libraries² in the United States, all having 100,000 volumes or more and 3 of the 8 are situated in New York City. These libraries according to size are: Surgeon General's Library, Washington, D. C., 409,250; The New York Academy of Medicine, New York City, 232,000; Boston Medical Library, Boston, 180,600; College of Physicians and Surgeons, Philadelphia, 176,000; Medical Society of the County of Kings, Brooklyn, 147,000; Wm H. Welch Library, The Johns Hopkins Hospital, Baltimore, 129,700; John Crerar Library, Chicago, 108,550; and Columbia University Medical School, New York City, 100,000.

It is interesting to note that outside of the national library the largest libraries have been established by medical societies, not by medical schools.

The medical libraries of New York State, arranged according to size, are shown in Table 1.

Classified according to type of library, these medical libraries are of several kinds, 8 are medical society libraries, 5 are state libraries, 7 are city- or county-supported libraries, 4 are supported by foundations, 9 are medical school libraries, 2 are memorial libraries, and 3 may be classified as sanitarium libraries. The remainder may be grouped as hospital libraries.

The medical society libraries are: The New York Academy of Medicine, Medical Society of the County of Kings, Rochester Academy

for a library, including correspondence for the society, bookkeeping, mailing meeting notices, attendance at meetings, and extensive telephone service. In medical libraries that are divisions of larger libraries, there is little, if any, cataloging, purchasing, bookkeeping, or correspondence. These factors must be remembered when considering the work load of a medical librarian.

Medical librarians in New York State, as in other states, tend to retain their offices for long terms, largely due, perhaps, to their extensive acquaintance with the material in the libraries and the lack of time on the part of the physician to search for the desired literature. No doctor has time to wade through the maze of medical literature printed today.

Six librarians in New York State have served for twenty years or more, 5 for fifteen years, 11 for ten to fourteen years, 7 for five to eight years, and 18 for five years or less, 3 did not state their years of service. Charles Frankenger of the Kings County Medical Library has served that organization for twenty-three years, earlier he was librarian for the Jefferson Medical College and before that time was on the staff of the College of Physicians of Philadelphia, receiving there his basic training from the well-known librarian, Charles Perry Fisher. Since 1926 Mr Frankenger has served as consulting librarian and special lecturer at the Long Island College of Medicine, the first medical school in the country to institute a course on medical literature and bibliography as a required course in its curriculum.

[Copies of the above table may be obtained upon request.—Editor]

Differing from other medical libraries in most respects, the National Health Library in New York City must be considered separately. Supported by the National Health Council, it is a department of the Division of Laboratories and Research of the New York State Department of Health. It is maintained for the staff of the central laboratory in Albany and the branch laboratory in New York City. Laboratories of New York State approved for bacterial and pathologic examinations, 127 in number, consult this library. The library is for reference and research, and material is not lent outside the library except tissue slides. A current literature index is maintained with the *Library Index* published weekly, also, abstracts of important articles are prepared for users of the library.

From this survey, what can be said regarding the communities where medical libraries are few and sometimes inadequate? What are the opportunities for physicians in these areas to obtain medical literature? Where may they borrow books? Where may they have bibliographies prepared?

Some of the larger libraries refuse to lend to any but their own members, although nonmembers may use the books in the library, other libraries will lend books but will not prepare bibliographies without charge. Only 3 libraries provide package libraries—the University of Buffalo, the Municipal Reference Library in New York City, and Grasslands Hospital. A package library is a collection of reprints and clippings ready to send out upon request for material upon a given topic. Only 1 of these 3 libraries, the University of Buffalo, will lend to physicians not on the staff. The Albany Medical Library, being a State institution, cheerfully serves the physicians of the entire state, except those in New York City where ample facilities are at hand. Bibliographies are prepared and desired information is promptly sent out, the borrower paying mailing charges. Photostats and abstracts are prepared for a small charge. The extent of the service of this library cannot be measured since no account is kept of users, but medical men from all parts of the state make frequent use of its facilities.

Only 2 libraries—the Rochester Academy of Medicine and the Edward J. Meyer Memorial Hospital in Buffalo—stated that bibliographic service is offered to medical and nonmedical readers. The privilege of borrowing is not limited, but these libraries have few calls from outside their own communities.

The large libraries provide little bibliographic service, although they help readers to find material for themselves. Libraries of medium size provide a varying amount of such service for their members and a few give limited service to doctors outside. Small libraries are limited in scope because few journals are available.

Although refusing to lend their volumes to nonmembers, large libraries and some of the smaller ones are generous in lending to other libraries, so that libraries with limited budgets need expend their money only for the books and journals most in demand. The New York Academy of Medicine last year made 3,040 interlibrary loans, the New York State Medical Library made extensive loans but kept no account of numbers, other libraries giving considerable service were the University of Rochester, the University of Buffalo, Cornell Medical Library, New York Post-Graduate Library, and the Bassett Hospital Library in Cooperstown.

The advantage to the physician in these interlibrary loans is that, while he cannot borrow books directly from a library, he may read them in a nearby library that borrows from a larger library. The borrower pays cost of mailing.

If, however, the physician lives at a distance from a library so that interlibrary loans are impossible, he may obtain his desired material in a number of ways. First, if he is a subscriber to a loose-leaf system of medicine or surgery, the publisher will furnish him reference material, including abstracts, translations, and photostats, without charge. In requesting this service the physician should explain in detail what information he seeks and also list the material he has at hand. A limited amount of reference material will be received but it is usually a good selection.

Second, he may borrow any journal not more than two or three years old from the *Journal of the American Medical Association* if he sends 6 cents postage for each journal. Bibliographies are not prepared but considerable information may be obtained from this source. Also, a package library will be sent upon request. This is a satisfactory source for obtaining information regarding other physicians, medical laws, and medical organizations.

Third, and most satisfactory, is to write to the New York State Medical Library at Albany, whose splendid service has already been described. Fourth, the physician may write to a small library in his vicinity asking

Greater New York	15 080	125	27

* Vicinity of Greater New York City

Another librarian with a long service record is Mrs Josephine Nichols of the Cornell University Medical School in New York City, having held her position as librarian for the past twenty years. Previous to that appointment she published a number of genealogies and did other research work in libraries. She prepared for her present position at Teachers College.

Twenty-four years of service are credited to Miss Sara L Halliday of the Library of the Department of Health in the City of New York. Her earlier efforts were in the South Orange, New Jersey, Library and in the Lederle Laboratories. Her library serves the Department of Hospitals, as well as the Department of Health, and her work includes preparation of a weekly sheet called "Have You Read," directing attention to the latest articles on public health. In addition, Miss Halliday prepares the December issue of *Notes*, a pamphlet published by the Municipal Reference Library in New York City, in which are listed all new accessories for the year.

Dr L A Damon has been librarian at Craig Colony for a period of twenty years. Miss Alice T Thayer, daughter of a physician who was formerly on the staff of the Chifton Springs Sanitarium, has served in the library for twenty-one years. Sixteen years of service has been given by Mrs Edith L M Keller at the New York Post-Graduate Medical School and by Miss Louise S Houghton at the Schenectady Medical Library.

Mrs Myra D Fredericks at the Grosvenor Library in Buffalo, Dr Archibald Mallock at The New York Academy of Medicine, and Miss Mabel E Parson at the Bureau of Laboratories Library in New York City have all served for fifteen years.

An important finding in the survey was the location of the medical libraries throughout the state. It is to be expected that the largest cities will have the greatest number of libraries, the largest in size, and also the greatest number of hospital libraries. Wherever there is

a medical school a library of considerable size will be found. In the Greater New York area are the great and small libraries of the state, 28 in number, more than half of the number considered in this survey. In Buffalo are 4 libraries, 2 in Rochester, 2 in close proximity in Saranac and Trudeau, and 2 in Westchester County. The remaining 10 are scattered through ten counties (Table 4).

Forty-seven counties of the state have no libraries except those with less than 500 volumes, which are provided by local hospitals. The twenty counties having libraries included in this survey are Albany, Broome, Dutchess, Erie, Essex, Franklin, Livingston, Monroe, Oneida, Onondago, Ontario, Otsego, Saratoga, Schenectady, Westchester, Bronx, New York, Kings, Queens, and Richmond. According to Dr Lawrence, only one county—Hamilton—has no hospital, but most of the residents are within an hour's drive of a good one.

The next consideration is the annual subscriptions in the various libraries. It is of interest to note that the largest libraries annually receive more foreign journals than domestic. These depository libraries endeavor to take the best of all journals published in foreign lands. In The New York Academy of Medicine, 1,490 foreign and 830 domestic journals are received annually, a remarkable total of 2,320 medical journals. Other large libraries include the Kings County Medical Library with 836 foreign and 730 domestic journals, Columbia with 533 foreign and 510 domestic, and the University of Rochester with 300 foreign and 216 domestic. With the exception of Cornell University, which received 170 foreign and 85 domestic journals, all other libraries of the state receive annually more American journals than foreign.

In comparing amounts spent for books, journals, and binding, it was found that except in one instance considerably more was expended for journals than for books or for binding. The exception is New York Post-Graduate Library which allowed \$1,640 for journals and \$2,060 for books. The cost of binding in most instances equals or exceeds that of books. There are exceptions where the library does not make a practice of binding its journals or else the cost of binding is paid from funds outside the library budget. During depression years many libraries deferred binding the less-used journals and are now gradually working them through the annual lot, a fact that explains, in some instances, the present high cost of binding.

Maternal Welfare

Heart Disease in Pregnancy

PREGNANCY in patients with heart disease should be considered as a serious condition, deserving of the most careful consideration

Case Report

Mrs L G, aged 35, gravida 1, last menstrual period, November 20, 1938, expected confinement August 27, 1939. At the age of 10, the patient had rheumatic fever, had been in bed for six months, and had developed mitral stenosis. During the ensuing three years, the patient had been handled as an invalid, following this period, however, she led a normal life and recently was able to perform her household duties, dance, play golf, etc., without difficulty. There was no history of definite decompensation. During the past year the patient had been treated for a gastric ulcer. She elected to assume the risk of pregnancy against the advice of her physician.

A physical examination was negative except for the heart, which was enlarged to the left nipple line. There was a mitral presystolic murmur which was transmitted to the left axilla. There was also a systolic blow in the aortic region. The pelvis was normal.

At five months' gestation the patient developed whooping cough. Except for this the pregnancy was uneventful. The pulse varied from 88 to 116 and was regular except on one occasion—in the eighth month a few extra systoles were found. The patient was kept at bed rest during the last month of the pregnancy.

On August 3, 1939, the membranes ruptured spontaneously and pains started. The patient was immediately hospitalized. Examination revealed the baby in a right occipitoposterior position, the head was unengaged. The lower segment was thick, the cervix was $1\frac{1}{4}$ inches long and undilated. Because of these findings a long labor was anticipated, and it was deemed advisable to deliver the baby by cesarean section. During the latter part of the operation, the patient decompensated. She had a stormy convalescence, developing a bronchopneumonia and wound infection. She was desperately ill for one week but eventually made a good recovery and was discharged from the hospital on the twenty-seventh postoperative day.

The patient was bedridden for several months with occasional mild decompensation. When the baby was 6 months old, she undertook her household duties against advice. After a particularly strenuous day, she suddenly decompensated and expired.

It is difficult to estimate the amount of strain that a diseased heart will stand during pregnancy and labor. We have no efficient method of measuring cardiac efficiency. Unquestionably, however, our best index is a consideration of compensation. An individual who gives a history of repeated cardiac decompensation must be advised against pregnancy. If such a patient does

become pregnant, therapeutic interruption should be considered. Certainly, if decompensation takes place early in pregnancy, interruption is indicated, the interruption should not be done, however, until the patient has regained compensation. On the other hand, if a patient decompensates for the first time during the latter months of pregnancy, she is probably best handled by re-establishing compensation and carrying on to term with the patient at complete bed rest.

What shall we do about the pregnant patient in whom murmurs or other signs of possible cardiac disease are found early in pregnancy? Of course, it is necessary to establish a definite diagnosis—many functional murmurs are encountered. It would seem logical to obtain the opinion of an expert cardiologist. In the presence of true cardiac pathology an obstetric opinion is also indicated. Cardiac patients need more rest than the normal obstetric patients, in many instances bed rest for a month or two prior to labor is essential. Activity should be restricted. Many other factors need careful attention. Best results will be obtained by a combined consideration to outline the conduct of such cases.

The question of the complete or partial digitalization of cardiac patients just prior to, or during, labor often comes up for discussion. In general, it may be said that it is best to hold digitalization in reserve for possible decompensation. This matter should receive due attention and consideration.

Fortunately, most cardiac patients will have comparatively easy labors. Vaginal delivery will give best results unless some unusual circumstance, such as a contracted pelvis or a particularly unfavorable position of the fetus, enters the picture. However, it is quite generally agreed that the second stage should be eliminated as far as possible. Most decompensations occur as the result of the patient's effort in straining during the second stage. It must be admitted, however, that a normal second stage might throw less strain on the heart than a poorly conducted operative delivery under prolonged general anesthesia by an inexperienced operator. The elimination of the second stage must presuppose the delivery by expertly handled forceps extraction with proper anesthesia.

Rarely, a patient will decompensate in the first stage of labor. In such an instance a truly grave situation is created. In such a situation the patient must be digitalized as rapidly as possible and treated conservatively until the first stage is completed. If possible, compensation should be restored before delivery is attempted. With complete dilatation the patient should be de-

the help of the librarian and, unless the library has definite rules against giving such assistance, the librarian will usually give the desired help

If the doctor is willing to pay the required fees, he may obtain bibliographies, abstracts, and photostats or translations from any of the large libraries

No physician can hope to read all or even a large percentage of the medical literature published annually, not even the 830 domestic journals received each year at The New York Academy of Medicine. Yet he can keep informed within his particular field by borrowing the best journals from nearby sources. Many physicians subscribe to the *Journal of the American Medical Association*, the *New York State Journal of Medicine*, and two to ten other journals, ten being more than the average, but often the periodicals in his own office prove inadequate and he must seek further information. With all the facilities offered to him, the New York State physician need not lack whatever medical literature he requires

In small communities having no medical libraries, physicians should encourage and assist nearby hospitals to build up their libraries to meet the requirements of the American Medical Association.¹ If sufficient funds cannot be obtained, it is suggested that the hospital expend \$15 annually to become a member of the Medical Library Association and receive books and journals through its Exchange. Libraries receive much duplicate material that is gladly given to other libraries

that are members of the Exchange. Most libraries receive all the best journals and are, therefore, able to donate duplicate copies of these journals given them by doctors who subscribe regularly. It is astonishing how soon a small library may be built up in this manner. By purchasing standard textbooks, by subscribing to the *Accumulative Index* and to a few of the best journals, in addition to belonging to the Library Association, the small hospitals may provide well for their interns and staff members, and only when special reference material is required need the assistance of larger libraries be sought. In communities where ample library facilities are provided, the hospital library should be maintained at the minimum suggested by the A.M.A.

Summary

A survey of medical libraries in the State of New York has been made, showing location of the libraries, their size and use, and their availability to the medical profession of the state

Information has also been given regarding possibilities for obtaining medical literature by practitioners situated at a distance from established libraries

JELLIFFE LIBRARY TO HARTFORD

Acquisition of a 15,000 volume medical library described by bibliophiles as the most complete of its kind in the world is announced by Dr C Charles Burlingame, psychiatrist-in-chief of the Neuro-Psychiatric Institute of Hartford, Connecticut

The library, representing a lifetime of collecting by Dr Smith Ely Jelliffe, of New York, nationally known psychiatrist and editor of the *Journal of Nervous and Mental Diseases* and the *Psychoanalytic Review*, is to be transferred to the Institute "to assure a permanent home for it"

Dr Burlingame also made public the report on the Jelliffe Library by Mr Morris C Leikind of the Library of Congress. "The Jelliffe collection in neurology and psychiatry," states Leikind's report, "is probably the largest and most complete private library in its field in the country. In addition to the 15,000 volumes it contains 25,000 reprints and covers every aspect of the fields in which Dr Jelliffe is regarded as a master. The psychoanalytic section of the library is one of the best collections of its type to be found anywhere."

THE CULTS

The success of the chiropractors and other cults is well inferred by a remark of the late Dr Charles Mayo. He said, "Rub a dog's back and he's your friend." The cults have won the friendship and confidence of these unfortunate people who need sympathy and friendship, by rendering them just such service. With the help of your confreres, you can, and should, be able to hold these patients

While I do not believe we should spend our time and efforts talking about or condemning the cults, I do not agree with the medical man who believes we should sit back and let the cults thrive by exerting undue influence on our legislators or state officials. I am convinced that if the medical men of the past had put forth sufficient effort, few of these cults would have been licensed to practice their pseudomagic on deluded people. You will be the only properly trained group to see that healers outside your profession do not gain footholds in the future. Do not let politicians or other outside groups control the practice of medicine. Outside control means chaos and inferior medicine.—J M Hayes, M D, Minneapolis

Maternal Welfare

Heart Disease in Pregnancy

PREGNANCY in patients with heart disease should be considered as a serious condition, deserving of the most careful consideration

Case Report

Mrs. L. G., aged 35, gravida 1, last menstrual period, November 20, 1938, expected confinement August 27, 1939. At the age of 10, the patient had rheumatic fever, had been in bed for six months, and had developed mitral stenosis. During the ensuing three years, the patient had been handled as an invalid, following this period, however, she led a normal life and recently was able to perform her household duties, dance, play golf, etc., without difficulty. There was no history of definite decompensation. During the past year the patient had been treated for a gastric ulcer. She elected to assume the risk of pregnancy against the advice of her physician.

A physical examination was negative except for the heart, which was enlarged to the left nipple line. There was a mitral presystolic murmur which was transmitted to the left axilla. There was also a systolic blow in the aortic region. The pelvis was normal.

At five months gestation the patient developed whooping cough. Except for this the pregnancy was uneventful. The pulse varied from 88 to 116 and was regular except on one occasion—in the eighth month a few extra systoles were found. The patient was kept at bed rest during the last month of the pregnancy.

On August 3, 1939, the membranes ruptured spontaneously and pains started. The patient was immediately hospitalized. Examination revealed the baby in a right occipitoposterior position, the head was unengaged. The lower segment was thick, the cervix was $1\frac{1}{2}$ inches long and undilated. Because of these findings a long labor was anticipated, and it was deemed advisable to deliver the baby by cesarean section. During the latter part of the operation, the patient decompensated. She had a stormy convalescence, developing a bronchopneumonia and wound infection. She was desperately ill for one week but eventually made a good recovery and was discharged from the hospital on the twenty-seventh postoperative day.

The patient was bedridden for several months with occasional mild decompensation. When the baby was 6 months old, she undertook her household duties against advice. After a particularly strenuous day, she suddenly decompensated and expired.

It is difficult to estimate the amount of strain that a diseased heart will stand during pregnancy and labor. We have no efficient method of measuring cardiac efficiency. Unquestionably, however, our best index is a consideration of compensation. An individual who gives a history of repeated cardiac decompensation must be advised against pregnancy. If such a patient does

become pregnant, therapeutic interruption should be considered. Certainly, if decompensation takes place early in pregnancy, interruption is indicated, the interruption should not be done, however, until the patient has regained compensation. On the other hand, if a patient decompensates for the first time during the latter months of pregnancy, she is probably best handled by re-establishing compensation and carrying on to term with the patient at complete bed rest.

What shall we do about the pregnant patient in whom murmurs or other signs of possible cardiac disease are found early in pregnancy? Of course, it is necessary to establish a definite diagnosis—many functional murmurs are encountered. It would seem logical to obtain the opinion of an expert cardiologist. In the presence of true cardiac pathology an obstetric opinion is also indicated. Cardiac patients need more rest than the normal obstetric patients, in many instances bed rest for a month or two prior to labor is essential. Activity should be restricted. Many other factors need careful attention. Best results will be obtained by a combined consideration to outline the conduct of such cases.

The question of the complete or partial digitalization of cardiac patients just prior to, or during, labor often comes up for discussion. In general, it may be said that it is best to hold digitalization in reserve for possible decompensation. This matter should receive due attention and consideration.

Fortunately, most cardiac patients will have comparatively easy labors. Vaginal delivery will give best results unless some unusual circumstance, such as a contracted pelvis or a particularly unfavorable position of the fetus, enters the picture. However, it is quite generally agreed that the second stage should be eliminated as far as possible. Most decompensations occur as the result of the patient's effort in straining during the second stage. It must be admitted, however, that a normal second stage might throw less strain on the heart than a poorly conducted operative delivery under prolonged general anesthesia by an inexperienced operator. The elimination of the second stage must presuppose the delivery by expertly handled forceps extraction with proper anesthesia.

Rarely, a patient will decompensate in the first stage of labor. In such an instance a truly grave situation is created. In such a situation the patient must be digitalized as rapidly as possible and treated conservatively until the first stage is completed. If possible, compensation should be restored before delivery is attempted. With complete dilatation the patient should be de-

the help of the librarian and, unless the library has definite rules against giving such assistance, the librarian will usually give the desired help

If the doctor is willing to pay the required fees, he may obtain bibliographies, abstracts, and photostats or translations from any of the large libraries

No physician can hope to read all or even a large percentage of the medical literature published annually, not even the 830 domestic journals received each year at The New York Academy of Medicine. Yet he can keep informed within his particular field by borrowing the best journals from nearby sources. Many physicians subscribe to the *Journal of the American Medical Association*, the *New York State Journal of Medicine*, and two to ten other journals, ten being more than the average, but often the periodicals in his own office prove inadequate and he must seek further information. With all the facilities offered to him, the New York State physician need not lack whatever medical literature he requires.

In small communities having no medical libraries, physicians should encourage and assist nearby hospitals to build up their libraries to meet the requirements of the American Medical Association.¹ If sufficient funds cannot be obtained, it is suggested that the hospital expend \$15 annually to become a member of the Medical Library Association and receive books and journals through its Exchange. Libraries receive much duplicate material that is gladly given to other libraries

that are members of the Exchange. Most libraries receive all the best journals and are, therefore, able to donate duplicate copies of these journals given them by doctors who subscribe regularly. It is astonishing how soon a small library may be built up in this manner. By purchasing standard textbooks, by subscribing to the *Accumulative Index* and to a few of the best journals, in addition to belonging to the Library Association, the small hospitals may provide well for their interns and staff members, and only when special reference material is required need the assistance of larger libraries be sought. In communities where ample library facilities are provided, the hospital library should be maintained at the minimum suggested by the A M A

Summary

A survey of medical libraries in the State of New York has been made, showing location of the libraries, their size and use, and their availability to the medical profession of the state.

Information has also been given regarding possibilities for obtaining medical literature by practitioners situated at a distance from established libraries.

JELLIFFE LIBRARY TO HARTFORD

Acquisition of a 15,000 volume medical library, described by bibliophiles as the most complete of its kind in the world is announced by Dr C Charles Burlingame, psychiatrist-in-chief of the Neuro-Psychiatric Institute of Hartford, Connecticut.

The library, representing a lifetime of collecting by Dr Smith Ely Jelliffe, of New York, nationally known psychiatrist and editor of the *Journal of Nervous and Mental Diseases* and the *Psychoanalytic Review*, is to be transferred to the Institute "to assure a permanent home for it."

Dr Burlingame also made public the report on the Jelliffe Library by Mr Morris C Leikind of the Library of Congress. "The Jelliffe collection in neurology and psychiatry," states Leikind's report, "is probably the largest and most complete private library in its field in the country. In addition to the 15,000 volumes it contains 25,000 reprints and covers every aspect of the fields in which Dr Jelliffe is regarded as a master. The psychoanalytic section of the library is one of the best collections of its type to be found anywhere."

THE CULTS

The success of the chiropractors and other cults is well inferred by a remark of the late Dr Charles Mayo. He said, "Rub a dog's back and he's your friend." The cults have won the friendship and confidence of these unfortunate people who need sympathy and friendship, by rendering them just such service. With the help of your confreres, you can, and should, be able to hold these patients.

While I do not believe we should spend our time and efforts talking about or condemning the cults, I do not agree with the medical man who believes we should sit back and let the cults thrive by exerting undue influence on our legislators or state officials. I am convinced that if the medical men of the past had put forth sufficient effort, few of these cults would have been licensed to practice their pseudomagic on deluded people. You will be the only properly trained group to see that healers outside your profession do not gain footholds in the future. Do not let politicians or other outside groups control the practice of medicine. Outside control means chaos and inferior medicine.—J M Hayes, M D, Minneapolis

Heart Disease in Pregnancy

PREGNANCY in patients with heart disease should be considered as a serious condition deserving of the most careful consideration

Case Report

Mrs. L. G., aged 35, gravida 1, last menstrual period, November 20, 1933, expected confinement August 27, 1939. At the age of 10, the patient had rheumatic fever, had been in bed for six months, and had developed mitral stenosis. During the ensuing three years, the patient had been handled as an invalid, following this period, however, she led a normal life and recently was able to perform her household duties, dance, play golf, etc., without difficulty. There was no history of definite decompensation. During the past year the patient had been treated for a gastric ulcer. She elected to assume the risk of pregnancy against the advice of her physician.

A physical examination was negative except for the heart, which was enlarged to the left nipple line. There was a mitral presystolic murmur which was transmitted to the left axilla. There was also a systolic blow in the aortic region. The pelvis was normal.

At five months gestation the patient developed whooping cough. Except for this the pregnancy was uneventful. The pulse varied from 88 to 116 and was regular except on one occasion—in the eighth month a few extra systoles were found. The patient was kept at bed rest during the last month of the pregnancy.

On August 3, 1939, the membranes ruptured spontaneously and pains started. The patient was immediately hospitalized. Examination revealed the baby in a right occiputoposterior position, the head was unengaged. The lower segment was thick, the cervix was $1\frac{1}{4}$ inches long and undilated. Because of these findings a long labor was anticipated, and it was deemed advisable to deliver the baby by cesarean section. During the latter part of the operation, the patient decompensated. She had a stormy convalescence, developing a bronchopneumonia and wound infection. She was desperately ill for one week but eventually made a good recovery and was discharged from the hospital on the twenty-seventh postoperative day.

The patient was bedridden for several months with occasional mild decompensation. When the baby was 6 months old, she undertook her household duties against advice. After a particularly strenuous day, she suddenly decompensated and expired.

It is difficult to estimate the amount of strain that a diseased heart will stand during pregnancy and labor. We have no efficient method of measuring cardiac efficiency. Unquestionably, however, our best index is a consideration of compensation. An individual who gives a history of repeated cardiac decompensation must be advised against pregnancy. If such a patient does

become pregnant, therapeutic interruption should be considered. Certainly, if decompensation takes place early in pregnancy, interruption is indicated, the interruption should not be done, however, until the patient has regained compensation. On the other hand, if a patient decompensates for the first time during the latter months of pregnancy, she is probably best handled by re-establishing compensation and carrying on to term with the patient at complete bed rest.

What shall we do about the pregnant patient in whom murmurs or other signs of possible cardiac disease are found early in pregnancy? Of course, it is necessary to establish a definite diagnosis—many functional murmurs are encountered. It would seem logical to obtain the opinion of an expert cardiologist. In the presence of true cardiac pathology an obstetric opinion is also indicated. Cardiac patients need more rest than the normal obstetric patients, in many instances bed rest for a month or two prior to labor is essential. Activity should be restricted. Many other factors need careful attention. Best results will be obtained by a combined consideration to outline the conduct of such cases.

The question of the complete or partial digitalization of cardiac patients just prior to, or during, labor often comes up for discussion. In general, it may be said that it is best to hold digitalization in reserve for possible decompensation. This matter should receive due attention and consideration.

Fortunately, most cardiac patients will have comparatively easy labors. Vaginal delivery will give best results unless some unusual circumstance, such as a contracted pelvis or a particularly unfavorable position of the fetus, enters the picture. However, it is quite generally agreed that the second stage should be eliminated as far as possible. Most decompensations occur as the result of the patient's effort in straining during the second stage. It must be admitted, however, that a normal second stage might throw less strain on the heart than a poorly conducted operative delivery under prolonged general anesthesia by an inexperienced operator. The elimination of the second stage must presuppose the delivery by expertly handled forceps extraction with proper anesthesia.

Rarely, a patient will decompensate in the first stage of labor. In such an instance a truly grave situation is created. In such a situation the patient must be digitalized as rapidly as possible and treated conservatively until the first stage is completed. If possible, compensation should be restored before delivery is attempted. With complete dilatation the patient should be de-

livered by forceps extraction No general anesthesia should be administered Local anesthesia may be employed, or the patient may be delivered without any anesthetic One thing is certain the addition of a difficult operative delivery to the burden of the already decompensated patient must end, many times, in an immediate fatality

Many questions arise concerning pregnancy and heart disease What advice should be given to a cardiac patient as to advisability of pregnancy? What should be done with the cardiac patient who sees the physician early in pregnancy and wants to know whether or not the pregnancy should be terminated? What should be done with the cardiac patient who has never decompensated before but does break down about the fifth month of pregnancy? What about the primiparous cardiac patient who becomes fully dilated with a posterior position? Should she

be rotated artificially or be allowed to rotate spontaneously?

These are a few of the questions, and certainly no article or series of articles is going to give satisfactory answers It is our purpose to point out that cardiac disease in pregnancy is always a potentially serious complication No one knows all the answers It does seem to make sense, however, to point out that every known or suspected cardiac patient who becomes pregnant is entitled to the combined opinion of her attending physician, a competent cardiologist, and an experienced obstetrician

WHAT THE PEOPLE SAY

Public opinion was sounded out on some interesting points in the recent survey of the care of the sick in Rochester As noted in the *J A M A*, one of the questions was to determine the attitude of the public toward medical insurance

While a decided majority expressed themselves in favor of some type of medical insurance, it was found when these replies were broken down by income classes that few of those in favor of it could afford such insurance and that the "theoretical potential market" for such insurance was only about 17 per cent of the total population Ninety-five per cent of the public gave a negative answer to the question "Has your family ever had any kind of difficulty in securing it when they needed medical, hospital, or nursing care?" Ninety-two per cent stated that they did not know of any family in Rochester that needed such care and was unable to get it

It may be significant of the confused character of the propaganda for "socialized medicine" that 43 per cent when asked "What, in your opinion, does the term 'socialized medicine' mean?" replied "Don't know" and that the rest gave replies that showed that they had little idea of the meaning of such a term

That the "family doctor" has not disappeared may be suggested by the fact that 80 per cent stated that when they wished to call a doctor they would "usually go to the same doctor" and that 95 per cent of them preferred an M D to any other type of practitioner

MEDICAL PROFESSION'S WEAK SPOT

American medicine, as an authority recently observed, has a weak spot, remarks the *Lapeer County Press*, Lapeer, Michigan It is not a weakness affecting the patient—the sick man or woman anxiously seeking a return to health. Curiously enough, this weakness has helped the patient—for the weakness lies in the fact that the medical profession has been so busy fighting disease in experimental laboratories as well as at the bedsides of the ill that it has found little time to tell the public of its tremendous achievements

The undeniable record is there for all who wish to read it And it tells, through the figures, a dramatic and inspirational story of an endless battle against disease and suffering and death.

That battle has won victory after victory In the period of a century and a half in this country, the life expectancy of man has nearly doubled from thirty-five to sixty-two years During that time, typhus, one of the greatest killers, has all but disappeared Smallpox and diphtheria, dreaded specters not so long ago, have been robbed of their terrors Other great scourges—typhoid, diabetes, tuberculosis—have been brought under control and their mortality rates steadily reduced

Medicine is not an industry But, like industry, it has rendered its greatest service to the people under a system which places no brakes upon the achievements of the individual, and which encourages any man, in any field, to develop his talents to the utmost

AMERICAN BOARD OF OBSTETRICS AND GYNECOLOGY

This Board will hold its annual dinner for Diplomates, and others interested in the work of the Board, on Wednesday evening, June 4, 1941, at the Wade Park Manor Hotel, Cleveland, Ohio, immediately following the close of the Part II examinations Diplomates certified at the pre-

ceding days' examinations will be introduced personally, and there will be several speakers

Tickets at \$3.25 each may be obtained from Dr Joseph L Baer, chairman, 104 S Michigan Avenue, Chicago, Illinois, or at the Registration Desk during the examination period

(Number two in a series of six.)

Common problems in the management of peptic ulcer

*"What are you doing to obtain such
rapid ulcer healing?"*

A ray examination demonstrates a decrease in the size of the ulcer in 10 days when Amphojel* is administered by the continuous intra gastric drip. Pain is relieved in 8 to 24 hours.

Four striking features of Amphojel, Wyeth's Alumina Gel, are recognized by clinicians

Amphojel provides prompt relief from pain. It permits rapid healing of the ulcer. It cannot be absorbed and eliminates the hazard of alkalosis. It reduces excess acidity without completely neutralizing the gastric contents.

Amphojel is a valuable adjunct in the treatment of melena and hematemesis when administered by continuous drip.

AMPHOJEL

*Wyeth's
Alumina Gel*

Amphojel, Wyeth's Alumina Gel Fluid Antacid Adsorbent

One or two teaspoonfuls either undiluted or with a little water to be taken five or six times daily between meals and on retiring.
Supplied in 12-ounce bottles

For the Convenience of Ambulatory Patients

Wyeth's Hydrated Alumina Tablets Antacid

One-half or one tablet in half a glass of water. Repeat five or six times daily between meals and on retiring.
Supplied in boxes of 60 tablets

Say you saw it in the NEW YORK STATE JOURNAL OF MEDICINE

Medical News

County News

Albany County

Dr Cary Eggleston, assistant professor of clinical medicine, Cornell Medical College, addressed the county society on April 23 at the Albany College of Pharmacy, on "Current Concepts of Coronary Artery Disease and Myocardial Infarction." Discussion was opened by Dr F Stanley Randles.

Prior to the address, a business meeting was held, with Dr Thomas O Gamble presiding.

Bronx County

The program at the meeting of the county society on April 16 was a Symposium on Sclerosing Therapy (A) Injection Treatment of Varicose Veins by Dr Grant P Pennoyer, (B) Injection Treatment of Hemorrhoids by Dr Frank C Yeomans, (C) Injection Treatment of Hernia by Dr Daniel C Patterson, (D) Discussion by Drs Julius K Littman, Frank M Frankfeldt, and Bradley L Coley, and (E) General Discussion.

The Medical Board of Morrisania City Hospital tendered a testimonial dinner to Drs Nathan B Van Etten, Terry Townsend, S Philip Goodhart, and James M Gates, at the Biltmore on April 26. The proceeds of the dinner were distributed to the Social Service Auxiliary and the Medical Reference Library.

The Bronx Gynecological and Obstetrical Society met at The Concourse Plaza Hotel on April 28. The program was as follows: "The Palatal Arch and the Pelvis" by Drs Abraham J Rongy and Abraham B Tamis, with discussion by Dr Milton J Goodfriend, and "The Role of the Rh Factor in Transfusion Accidents in Pregnancy and in the Pathogenesis of Erythroblastosis Foetalis" by Dr Philip Levine.

The North Bronx Medical Society held a dinner-dance at the Hotel St Montz on April 27.

Cayuga County

The annual spring meeting of the county society was held at the Auburn City Hospital on April 18 with a large attendance of members and physicians from several counties in central New York.

A cardiac clinic was held from 3 to 6 o'clock with presentation and examination of heart cases and discussions by Drs D A Haller and C P Thomas, of Rochester.

A dinner was held at the Osborne Hotel at 7 o'clock with an attendance of nearly 100. Dr Wilfred Sefton, president of the county society, presided. The dinner was followed by a lecture by Dr Ernest P Boas, of New York City, on "Factors Which May Give Rise to Cardiac Infection."

Chemung County

The county society honored three members who have practiced a half century or more at a dinner on April 16 at the City Club in Elmira. They were Dr George M Case, who has

practiced 57 years, Dr LaRus Colegrove, 54 years, and Dr Floyd E Woodhouse, 50 years. Each has been outstanding in his specialty.

Dr Joseph S Lewis was toastmaster. Drs Arthur W Booth, Ross G Loop, and Reeve B Howland spoke.

Staff physicians of the Arnot-Ogden and St Joseph's hospitals and members of the county society had a joint dinner meeting at the Mark Twain Hotel in Elmira on April 23.

Dr Harry Fish, of Waverly, chief physician of the Tioga General Hospital discussed "Surgical Points." Motion pictures were shown. Dr George R. Murphy presided.

Erie County

The meeting of the county society on April 21 was devoted largely to preparations for the meeting of the state society.

Subscribers to the Western New York Medical Plan Inc. have increased from 1,215 to 2,673 since December 31, Dr George R. Critchlow, medical director, reported at the organization's annual meeting in Hotel Statler on April 17.

All officers were re-elected by the trustees as follows: president, Dr Harvey P Hoffman, of Buffalo, vice-president, Dr Louis L Klostermyer, of Warsaw, secretary, Dr Harold F Brown, of Buffalo, and treasurer, Merrill E Skinner, of Buffalo.

Trustees are Dr Klostermyer, Dr Arthur L Runals, Olean, Dr Edwin F Comstock, Wellsville, Seeley Pratt, Medina, Walter Howe, Olean, and Dr P J Di Natale, Batavia, and Louis L Berger, Buffalo.

The executive committee is made up of the officers and Supreme Court Justice R. Foster Piper, of Hamburg, Frederick B Cooley and Dr Carlton E Wertz, of Buffalo, and Dr J Louis Preston, of Salamanca.

"Despite the recent epidemic of gripe in the community, which resulted in many claims from subscribers for medical service, the plan has paid the doctors 100 cents on the dollar," Dr Critchlow declared.

"The substantial amount of time," Dr Hoffman said, that has been given by both the professional and lay directors has been devoted unselfishly for the joint benefit of the public and the profession. With such cooperation there should be no need for government intervention in the field of health economics.

Jefferson County

The county society met on April 24 at the Black River Valley Club. Dinner was served at 6:30. Dr Mervyn B Armstrong, assistant clinical professor of obstetrics and gynecology, Long Island College of Medicine, Brooklyn, spoke on "Hemorrhages of Pregnancy."

Kings County

The monthly meeting of the Rockaway Medical Society was held on April 17 at the Lawrence Village Park Clubhouse. Dr Clay

(Continued on page 1110)

COLLOIDAL IRON

VS

IONIZABLE IRON

THESE BASIC ADVANTAGES

Inherent in Ovoiderrin's Colloidal State

IN THE MOUTH

Ovoiderrin *does not* stain or dissolve tooth enamel because colloidal iron cannot do these things any more than an iron nail can. Ovoiderrin is iron in colloidal form in extremely minute subdivision and thus in a highly assimilable form. Ovoiderrin is also practically tasteless and odorless, but it does not rely upon sweetening, flavoring, coating, or masking to achieve these properties—they are inherent in its colloidal state.

IN THE STOMACH

Iron salts ionize into iron ions and acidic ions likely to produce astringent and irritating effects. And this is true, regardless of whether the salts be administered in pure form, in masked solution or in sugar-coated tablets. The iron in Ovoiderrin is not in ionic form. It is not affected by the gastric juice. It is stable and cannot irritate. Indeed, it actually appears to stimulate the appetite.

IN THE INTESTINE

Ovoiderrin arrives in the intestine in the form of a stable colloidal hydrous oxide which remains assimilable and does not dehydrate the intestinal contents. For 39 years this ease of assimilation has been evidenced by the rapid improvement which patients show when Ovoiderrin is prescribed. The unassimilated surplus of iron salts, (citrates, sulphates, etc.) on the other hand, reaches the colon as precipitates of iron oxide and salts of the acid radical. The former are dehydrating and may cause constipation while the latter may be irritating to the intestine. But these things cannot happen with Ovoiderrin because it is not broken down in the alimentary tract. It is already in a colloidal state, the state in which most nutriment must be to be absorbed. Ovoiderrin's palatability, its freedom from unpleasant properties, its high assimilability assure patient co-operation and better results. Write for physicians' sample.

OVOIDERRIN **COLLOIDAL IRON-PROTEIN** **BLOOD BUILDER**

In Secondary Anemia, Convalescence, Pregnancy,
"The Pale Child," and Run Down States

A. C. BARNES COMPANY

NEW BRUNSWICK, N. J.

[Continued from page 1108]

R. Murray, associate surgeon at the Presbyterian Hospital, spoke on "Fractures in General Practice."

Following Dr Murray's address, discussion was led by Drs I Reitzfeld and Irvin Balensweig. Plans were formulated for the annual dinner and dance.

Livingston County

A meeting of Livingston County physicians was held at the Big Tree Inn, Geneseo, on April 16, to discuss the availability of county physicians for military duty.

Nassau County

The program of the county society on April 22 included two sound motion pictures, "Good-by Mr Germ," and "Diagnostic Procedures," and the following scientific addresses: "The Public Health Aspects of Tuberculosis," by Dr Robert E Plunkett, general superintendent, Tuberculosis Hospitals, New York State Department of Health, "X-Ray in the Diagnosis of Tuberculosis," by Dr Ramsay Spillman, roentgenologist, Beekman Street Hospital, "Modern Treatment of Tuberculosis," by Dr H McLeod Higgins, associate, College of Physicians and Surgeons, and associate physician, Bellevue Hospital.

New York County

The county society met on April 21 at the Academy of Medicine building and listened to the following program: (1) "The Redistribution of Medical Care," by Algernon Black, Esq., leader of the Society for Ethical Culture in the City of New York, by invitation, (2) "How Politics Threatens Medicine," by Charles A. Togut, Esq., C.P.A., lawyer, New York City, by invitation, and (3) "Medical Thought in the Interest of the Patient," by Dr Roscoe Lloyd Sensenich, trustee of the American Medical Association, South Bend, Indiana, by invitation.

The well-known French literateur, André Maurois, will be the guest of the International Medical Club of New York City at its annual banquet on May 22. His address is to be entitled "At the Bedside of Civilization."

The section of surgery of The New York Academy of Medicine presented this program on May 2: Presentation of Cases (a) "Human Bites of the Hand," by Dr Roland L Maier, with discussion by Norman L Higinbotham, (b) Cases illustrating the first paper of the evening by Dr Lester Blum: "Papers of the Evening" (a) "The Use of Partial Myotomy in Flexor Tenorrhaphy," by Dr Lester Blum with discussion by Dr John H Garlock, (b) "Technic for Drainage of Suppurative Tenosynovitis of Fingers and Their Extension into the Flexor Base of Forearm," by Dr Hugh Auchincloss with discussion by Dr Philip C Potter, (c) "Puncture Wounds of the Hand," by Dr Condict W Cutler, Jr, with general discussion.

There was a combined meeting of the Academy Section of Obstetrics and Gynecology, Section of Pediatrics, New York Pathological Society and the New York City Committee on Prematurity on April 22. The papers of the evening were: (a) "The Pathology of the Premature

Infant," by Dr Sidney Farber, Harvard Medical School, (b) "The Chicago Plan for Reduction of Infant Mortality," by Dr Edith L Potter, University of Chicago School of Medicine, with discussion by Drs Rustin McIntosh, Beryl H Paige, and William E Studdiford.

As part of a survey of public health conditions in New York, the county society has asked 400 labor unions for data to be used in public hearings by the society.

Oneida County

The Utica Academy of Medicine and the Utica Dental Society held a joint dinner meeting at the Hotel Utica on April 17. Captain Edwin N Beery, Assistant, Office of the Surgeon, Second Corps Area, Governor's Island, New York spoke on "Medical Profession in a National Emergency."

Ontario County

"Soliloquy of a Country Doctor" was the subject of a paper by Dr J Wendell Howard, of East Bloomfield, before members of the Canandaigua Medical Society in the Canandaigua Hotel on April 10. Dinner was served to 14, with Dr D A. Eiselne, Shortsville, as host.

Orange County

Orange County doctors heard Lieutenant Bernard M Boylan, head of the Narcotic Division of the New York City Police, speak on the illegal traffic of drugs at the spring dinner of the county society in Thayer Hotel at West Point on April 8.

Queens County

The county society met on April 29 and heard a paper on "Hypertension" by Dr Arthur M Fishberg, associate physician, Mount Sinai Hospital, with discussion by Drs Goodwin A. Distler and Frank R. Mazzola.

The Friday Afternoon Talks on May 2 and 16 were scheduled as follows: May 2—"Treatment of Rheumatic Infection," by Dr Cary Eggleston, consultant physician, New York Infirmary for Women and Children, physician, Bellevue, associate physician, New York Hospital. May 16—"Diabetes Mellitus," by Dr David D Moore, assistant physician, Presbyterian Hospital, Vanderbilt Clinic, and Neurological Institute.

Schenectady County

The Doctors' Orchestra of Schenectady will play at the Bowl of Rice concert at Union College on May 17 for the benefit of the American Bureau for Medical Aid to China.

Schuyler County

It is announced that in keeping with the present-day medical fees throughout the state and the costs of medicines the county society is adopting a new fee schedule, effective May 1, as follows: Office Consultation, \$1.50 minimum, plus medicine, House Visits, Central Zone, Day, \$2.50, House Visits, Central Zone, 6 p.m. to 7 a.m., \$3.50, House Visits, Outside Central Zone, Day, \$2.50 plus 25 cents per mile one way, plus medicine, House Visits, Outside Central Zone

Tompkins County

At a regular meeting of the county society on April 15, Drs Arthur D White, Keith Sears, George L Rood, Benjamin F Kingsbury, and Robert H Fisher were all elected to Honorary membership

Dr Robert S Goodhart, of New York City, gave an excellent talk on "The Relations of Vitamins to Disease"

A frequent topic of conversation here is the splendid cooperation given to the local draft examiner We work it out in this manner From 15 to 20 physicians meet on one Sunday afternoon a month in the Old Armory of Cornell University These work in groups of one, two, or three as indicated, and the drafted men are passed on from group to group In this manner about 60 men may be examined in two hours — Reported by Willelts Wilson, M D

Warren County

Dr James M Flynn, Rochester, president of the State Society, spoke on "Organization in the Practice of Medicine" at the first of a proposed series of joint meetings of the Warren, Washington, and Saratoga County societies at the Queensbury in Glens Falls on April 14.

The meeting, attended by more than 75, also heard Dr Augustus Hambrook, of Troy, a member of the Council of the State Society and

chairman of its public relations and economics committee, speak on new restrictions in the motor vehicle law by which persons with conditions impairing their ability to drive may have licenses refused them or driving permits revoked on recommendation of the family physician

Dr Joseph Lawrence, of Albany, executive secretary of the State Society, reviewed the current medical legislation and spoke on medical preparedness in the physician's relation to the draft

Dr W C Cuthbert, of Hudson Falls, president of the Washington County Society, and Dr Pesquera, of Mt McGregor, president of the Saratoga County Society, also spoke Dr E J Fitzgerald, president of the Warren County Society, presided

Westchester County

Thirty-six catastrophe units consisting of two doctors, a nurse, and two first-aid assistants have been set up in the county in the interest of the health defense effort, Dr Edwin G Ramsdell informed the official advisory health preparedness committee on April 17 at a meeting in the County Office Building

Dr Ramsdell, chairman of the emergency and catastrophe committee, said the units, formed in collaboration with the county society and the county Red Cross, would be on call in all county towns in the event of any disaster

Dr Erich Restin, of Mount Vernon, who conducted the meeting, read the report of Carl E Wright, of Port Chester, chairman of the hospital, ambulance service, and supplies committee Mr Wright had found that there are 2,780 beds available in the county and that 2,086 more beds could be installed There are 17 convalescent homes and institutions with a bed capacity of 1,580, although a good percentage of these would not be available to county residents since they are in divisions of New York City institutions Fourteen hospitals have ambulance service

Workmen's Compensation

April 18, 1941

The Industrial Board of the Department of Labor on March 28, 1941, promulgated the following resolution

"Resolved, That the Industrial Board hereby rescinds its previous resolutions of June 7, 1940, and July 26, 1940

"Further Resolved, That the Industrial Board believes that it is the right of the claimant to furnish x-rays for all purposes in connection with his compensation claim, except that x-rays necessary in connection with final adjustment disposition, or otherwise for purely comparative or evaluation purposes, and not relating to diagnosis, treatment or continuation thereof, shall be furnished by the carrier. The referee shall direct the carrier to furnish the same, unless it appears that special circumstances require issuing a direction to the claimant to secure the x-rays. In such instance the referee shall furnish the claimant with a description of the nature of the x-rays required."

In explanation of the above, please note that it is the right of the claimant through his physician to furnish x-rays for all purposes in connection with his compensation claim relating to the diagnosis, treatment, and continuation of treatment. Where x-rays are necessary, however, in connection with the final adjustment of a claim by the Department of Labor or for comparative or evaluation purposes by the Department and not related to the diagnosis or treatment of the case, such x-rays shall be furnished by the insurance carrier. Under these circumstances the referee will direct the carrier to furnish them. If in the opinion of the referee, however, there are special circumstances in connection with the closing of the case or otherwise for evaluation or comparative purposes, the referee may issue a direction to the claimant to provide the x-rays and in such instance the referee shall furnish the claimant with a note containing a description of the nature of the x-rays required. The above resolution rescinds all previous resolutions issued by the Industrial Board regarding the supplying of x-rays for final adjudication of cases.

Should a claimant bring to a physician a report of a hearing and medical examination which indicates that the claimant is to be re-examined "with x-rays" for final adjudication of the claim, the physician should not refer the patient to an x-ray specialist unless first ascertaining from the carrier whether the carrier has not been directed to provide the x-rays by the referee. Should a claimant bring a direction from the referee requesting claimant to provide x-rays, the physician should provide only such x-rays as are requested in the order. If a physician or x-ray specialist is in doubt as to who is to provide the x-rays in an old case coming up for a hearing, he should, before making the examination, contact the Labor Department or the Insurance Carrier to ascertain whether an order for x-rays has been issued and to whom.

CEREVim*

Cerevim is a pre-cooked cereal food of high nutrient values carefully balanced for the dietary requirements and digestive abilities of babies. It gets its calcium and phosphorus from milk powder and it is distinctly appetizing.

Hence, a willing intake! Infants gain weight and height on Cerevim.

All of which was indicated in 1937 in controlled studies on infants by Joslin and Helms' whose teachings are followed in the Cerevim formula.

Cerevim was designed to be *baby's* first solid food at 4 months, yet

—it has food values needed in the diets of adult invalids or dyspeptics requiring soft, bland, low-ash, easily digested diets attractive to frail appetites,

—Admiral Byrd bought it for 25% of the balanced trail ration for his husky men in the Antarctic.

Woman's Auxiliary

To the Medical Society of the State of New York

County News

Broome The second anniversary of the auxiliary was celebrated March 26 at the Binghamton Country Club by having a dinner-dance. Mrs C D Squirres was chairman. Mrs J H Robertson, president, introduced Dr G H Armstrong of the I B M Corporation who spoke on "Some Interesting Facts You May Not Know About Industry."

Madison Mrs M Melamed, of Oneida, publicity chairman writes "The auxiliary to the Madison County Medical Society welcomed a visit from Mrs L H Kice, state president, March 26. They entertained at a spring dinner and afterward spent an informal evening at the home of Mrs O Pfoff, state historian. Out of town guests who were introduced by Mrs C Earl, president of the auxiliary, were Mrs C E Potter, Mrs F Erwing, and Mrs E Neptune, of Syracuse, and Mrs James Fanell, president of Oneida County Auxiliary."

Montgomery Mrs Albert Vander Veer, of Albany, legislative chairman, was guest speaker at a luncheon meeting held April 14 at the Elks Club. In her address she stated that legislation is one of the most important functions of the organization, and it is the duty of the committee to acquaint itself with bills and important legislative matter that concern the medical profession. Mrs E H Ormsby will be the delegate at the state convention.

Onondaga The regular monthly meeting of the auxiliary was held in the home of Mrs Edward C Reifenstein, Sr, on April 1, 1941. Mrs Foster C Rulison acted as Hostess Chairman. Mrs Albert Vander Veer, of Albany, state legislative chairman, was the guest speaker, and she discussed several current legislative problems. The members of the board of the auxiliary gave a dinner in Mrs Vander Veer's honor at the Hotel Syracuse. Mrs Edgar M Neptune, president, and Mrs W W Street, our first vice-president, entertained the members of the board at luncheon on March 25 following their regular meeting in the home of Mrs W W Street. A delightful afternoon was enjoyed by all.

Orange A luncheon meeting of the executive board convened at the Mitchell Inn, on April 1. Dr Theodore W Neumann, of Central Valley, spoke about plans for an annual Health Institute to be held at the Middletown State Hospital on May 6, 1941. Following the executive meeting the first regular meeting took place at the home of Mrs Harry F Pohlmann in Middletown. Thirty members and guests were present. Six new members were welcomed to the organization. Mrs Harry Chant, of Middletown, chairman of the Public Relations Committee gave the following report. Plans for committee activities for the year 1941 were considered at a meeting of the executive board held at the home of the president, Mrs H F Murray, Port Jervis, on January 7,

1941. This committee has continued to co-operate with the Middletown League of Women Voters, American Legion Auxiliary, Parent Teacher groups, and Child Study groups by providing club talks for use at meetings. In addition, the talk "Rheumatic Heart Disease" was provided for reading before the faculty of the Washingtonville School and St Joseph's Parochial School, Middletown. These groups are continuing to utilize club talks as they become available. Plans are being made for presentation of the talk "Preventive Medicine and Child Health" at a meeting on Family Life to be conducted by the Home Bureau in Middletown on April 8, 1941. The regional director of the Parent Teachers Association is planning to have a talk given before their western New York conference. Mrs George Kenny, of Port Jervis, chairman of Legislation, reported that she had attended the Doctor's Legislative Committee in Albany. After the business session we were entertained with sound movies on "Driving Safely" and a colored movie of Middletown Flower Gardens.

Oswego The auxiliary is making "Aid for Britain" its special work for April. Mrs H J La Tulip, chairman, has contacted hospitals and members of lay organizations from whom she has received favorable response. A luncheon meeting was given at the Fulton Club, April 21.

Rockland An unusually fine program delighted the doctor's wives at a luncheon meeting at the Hotel St George, Nyack, on April 22. Mrs T W Olmstead had the pleasure to present Mrs L H Kice, state president, as their guest of honor and speaker. Mrs Kice in her charming and able manner told the group of the types of health and social programs which it could carry out and their value to a community. A program of Scottish music, which was explained by Mrs S Kivalwasser, was sung by Mrs F Woodward, accompanied by Mrs Wm Walker. Mrs Olmstead announced that Dr S W S Toms has turned over his entire surgical equipment for British War Relief. Our praises to Rockland County Auxiliary.

Saratoga Twenty-six members attended a meeting April 1 at the Cramer House to hear Miss Elizabeth Henry, supervisor on Maternal Welfare, speak on public health work as conducted in Saratoga County. The final plans have been made to hold a Mental Hygiene Clinic at the Saratoga High School on May 22. In the afternoon Dr Frances Vosburg will speak on "The Adjustment Period in Adolescent Girls," and in the evening Dr F L Patry will speak on "Mental Hygiene for Business Women." For the recreation and enjoyment of its members the annual dinner-dance took place on April 24 at Newman's Lake House.

Hospitals and Sanitariums

Institutions of Specialized Treatments

SERVING AMERICA'S MOST DENSELY POPULATED MARKET

Sanitariums appearing in this department of the JOURNAL are conveniently located to a population greater than that of many of the countries now overrun by aggressors across the seas

The Metropolitan District of Greater New York, undoubtedly the richest buying center in the world, contains one-tenth of the people of the United States. Now comprising the five city boroughs and twenty-three suburban counties, this area reaches sixty miles in every direction and has a total population of over twelve millions. Some idea of the number of persons living in the area may be gathered from the fact that the total would make five cities as large as Chicago, Philadelphia, Detroit, Los Angeles, and Cleveland, and still leave a sufficient number to make three more cities with populations of a million each.

The area covers over 10,000 square miles, of which 4,134 are in New York State, 4,468 in New Jersey, and 631 in Connecticut. Yet from the heart of the city to the very finest private sanitariums and hospitals the traveling time is no more than an hour or two. This is one of the chief features that makes these sanitariums

more serviceable to the practicing physicians in the territory who desire to cater to the wish of relatives wanting the patient within easy visiting distance.

While distance may often be an issue with the immediate family of the patient, the recommending physician is probably more often confronted with the notion that treatment at private sanitariums is a luxury. This mistaken idea is due rather to lack of information and unsupported conclusions than to any logic. The same persons who may object to considering the use of a sanitarium will think nothing of paying from \$4.50 to \$7.00 and more per day for a single room only at a respectable hotel, or from \$30.00 to \$50.00 per week.

The personal service included is limited almost entirely to "making up the bed" once a day. If meals are also considered, the total weekly cost mounts up to from \$50.00 to \$70.00 or more. This for living accommodations and food for a healthy individual needing little if any personal attention.

On the other hand, the patient at a private sanitarium must have a room, must have meals and room service.

(Continued on page 1119)

FALKIRK IN THE RAMAPOSS

A sanitarium devoted exclusively to the individual treatment of MENTAL CASES. Falkirk has been recommended by the members of the medical profession for half a century.

REVIEWED

The Doctor and the Difficult Child. By William Moodie, M.D. Octavo of 214 pages. New York, The Commonwealth Fund, 1940. Cloth, \$1.50.

This is a small volume written by an English psychiatrist, who has been the director of the London Child Guidance Clinic for many years. The author's approach to the problem child is put down in understandable language and differs little from that of other writers on the subject. The etiology of the so-called problem child must be carefully sought by a detailed history from both parents as well as the teacher. It is an easy matter for a doctor to simply "laugh off" any of these problems by saying "Oh, well, the child will grow out of it."

Mental retardation many times is not recognized in early youth, and this must certainly be differentiated from other environmental disturbances that may cause the child to misbehave.

Part II of the book is taken up with a discussion of more specific disturbances, such as stealing, lying, dreaming, backwardness, nervous movements, enuresis, sex difficulties, speech defects, lack of concentration, and so on.

It is a worthwhile book for any practitioner to have in his library.

THURMAN B. GIVAN

The American College of Physicians Its First Quarter Century. William G. Morgan, M.D., Historian. Quarto of 275 pages, illustrated. Philadelphia, The American College of Physicians, 1940. Cloth.

It is indeed interesting reading to follow the story as given in the pages of this book. As is true of so many organizations, this one, too, had its trials and tribulations which necessitated several reorganizations before it began the course it has so successfully followed. Dr. Wm. Gerry Morgan is the chief contributor. He narrates the founding of the College, giving a brief biographic sketch of its seventeen presidents and of many other officers whose influence was of value in the progress and in the accomplishments of the College. Dr. Morgan writes clearly and interestingly. Other contributors to this volume of 275 pages are Edward R. Loveland, the executive secretary, Drs. Maurice C. Pincoffs, Walter L. Bierring, Charles F. Martin, and James A. Miller. Among its past-presidents are names of noted clinicians, among its over 4,000 Fellows and 2,300 Associates are many prominent clinicians of the country. As organized and conducted now the American College of Physicians will grow in power and prestige and exert a profound influence on American medicine.

S. R. BLATTEIS

Medical Care. Number 4 of Volume VI of "Law and Contemporary Problems." Quarto. Durham, Duke University Press, 1939. Paper, \$0.75.

Law and Contemporary Problems, a quarterly published by the Duke University School of Law, contains a series of articles devoted to the general subject of medical care, beginning with an introduction to national problems of medical care and running through practically every phase of the problem including the experiments in meeting medical needs by voluntary action, contract and corporate practice of medicine, nonprofit hospital service plans, from the point of view of enabling legislation and contract provisions and administrative procedures, a description of the Michigan Act, the organization of California physicians' service, the medical care program under the Farm Security Administration, the antitrust prosecution against the American Medical Association, the background of the national Wagner Health Bill and public medical services under that bill, legislative proposals for compulsory health insurance, disability insurance program, and a study of the formulas for grants-in-aid in the Wagner Bill.

In this table of contents, anyone interested in the problem of the provision of medical care from the legal and other points of view will find much of value.

This is one of the documents that a physician interested in discussing medical economics should peruse.

ALEC N. THOMSON

A Surgeon's Life. The Autobiography of J. M. T. Finney. Octavo of 396 pages. New York, G. P. Putnam's Sons, 1940. Cloth, \$3.50.

This is a readable and an interesting life story of a great man, who happened to be, also, a distinguished physician, surgeon, and teacher. If one is inclined to pass over the story of the childhood years, he will stop and read about the Princeton period of study, where the future doctor played football, and gained the title of "Sluggo" Finney. His medical training was at Harvard, but he soon became identified with Johns Hopkins and served under and with Dr. Halsted. He has added his unqualified approval of the Hopkins' system of medical education and training and devotes considerable space to the appreciation of the many men, besides the "Big Four," who were and are involved in the Hopkins' schema. It is unfortunate that some of the reminiscences of Dr. Halsted do not add to the attractiveness of his personality.

Dr. Finney's experiences in the World War of 1914 to 1918 are modestly and interestingly told. He tells us of his successes but is big enough to include his failures. His philosophic observations on doctors and the practice of medicine ring with a note of optimism when he says "Are our ideals too high? After over fifty years of close association with members of the profession, frankly, I do not think so."

Editorial

Chronology of Medical Student Deferment

Brigadier General Lewis B. Hershey, deputy director, Selective Service (May 3, 1941), instructed state and local boards to defer military training for medical students who "give reasonable promise of becoming acceptable medical doctors." To avert a possible national shortage of physicians, state and local boards were instructed to continue such deferments as long as the students progressed satisfactorily.

Thus, a major campaign in which this JOURNAL had a small part has come to a conclusion that seems to be in the national interest. The continuity of medical student training apparently will not be interrupted. This JOURNAL does not advocate deferment of any class, at any time. It does advocate, however, the induction of medical students of draft age into the service with, thereafter, immediate transfer to the reserves until such time as the full medical training course can be completed. Thus, any class distinction may be avoided. This procedure was actually carried out during World War No. 1.

The attention of the editors of your JOURNAL was called to the seriousness of the medical student problem under the Selective Service Act by a speech delivered in Chicago on February 17, 1941, by Dr. Ray Lyman Wilbur. He said "The nation's great mass operation of defense extends certain of our activities and limits others, but in no way does it change the essential fact that the defense of a great democracy will require as many, if not

more, thoroughly trained medical men as in times of peace." We wrote to Dr. Wilbur.

March 18, 1941, Dr. Wilbur replied, in part "that it requires time and training to prepare a young doctor to take his place in the profession at the moment I am interested as much in recruiting at the bottom, from the colleges to the medical schools, as I am in protecting the students now in actual training. At present there is considerable confusion between political expediency and the actual requirements of trained men to fight a modern war. We should all unite in trying to educate ourselves and the public not to the exemption of prospective medical students or actual medical students but to give them the adequate training so that they can serve our country in the very best way."

April 15, 1941, this JOURNAL carried a lead editorial entitled "Medicine and Military Needs." Based on this, the Public Relations Bureau issued a news release for publication on April 16 to all city desks of newspapers, the wire services, and radio stations in the state. At least one radio news commentator and many local papers in the state and over the country used this in part or wholly.

April 16, 1941, the Gallup poll revealed public opinion to be 87 per cent favorable to deferment of medical students until the completion of their training.

On April 28 and 29 two resolutions were

He said "The nation's great mass operation of defense extends certain of our activities and limits others, but in no way does it change the essential fact that the defense of a great democracy will require as many, if not

more, thoroughly trained medical men as in times of peace." We wrote to Dr. Wilbur.

March 18, 1941, Dr. Wilbur replied, in part "that it requires time and training to prepare a young doctor to take his place in the profession at the moment I am interested as much in recruiting at the bottom, from the colleges to the medical schools, as I am in protecting the students now in actual training. At present there is considerable confusion between political expediency and the actual requirements of trained men to fight a modern war. We should all unite in trying to educate ourselves and the public not to the exemption of prospective medical students or actual medical students but to give them the adequate training so that they can serve our country in the very best way."

April 15, 1941, this JOURNAL carried a lead editorial entitled "Medicine and Military Needs." Based on this, the Public Relations Bureau issued a news release for publication on April 16 to all city desks of newspapers, the wire services, and radio stations in the state. At least one radio news commentator and many local papers in the state and over the country used this in part or wholly.

April 16, 1941, the Gallup poll revealed public opinion to be 87 per cent favorable to deferment of medical students until the completion of their training.

On April 28 and 29 two resolutions were

introduced on the floor of the House of Delegates at the One Hundred and Thirty-fifth Annual Meeting of this Society relating to deferment of medical students. Through the Public Relations Bureau these were released to the press and the wire services, and they evoked widespread news and editorial comment.

The May 1 issue of the JOURNAL again carried a lead editorial "Medical Student Training." In this, much factual material obtained through the good offices of Dr Willard C Rappeye, secretary of the Association of American Medical Colleges,

was published. This followed, by four days, an interview by Dr Malcolm Goodridge of The New York Academy of Medicine, published in the New York Times, April 27, on the same subject—namely, the "possible shortage of doctors for both military and civilian needs."

We comment at length upon this chronology so that the members of this Society may feel that they, through their JOURNAL and their Public Relations Bureau, have actively participated in a successful campaign of public instruction upon a most vital subject.

See Your Legislators

The House of Delegates at the One Hundred and Thirty-fifth Annual Meeting of the Medical Society of the State of New York voted unanimously "to adopt an expression of appreciation to the members and officers of the Legislature, and especially to the Governor, for the courteous reception extended to the representatives of the medical profession and the thoughtful consideration they have given medical and public health measures that have come before them."

Legislators are not mindreaders, however disposed they may be to cooperate with their constituents and with the medical profession. They are not mindreaders but lawmakers. To make laws

wisely they must be accurately informed. And especially is this true concerning matters medical, since such matters are frequently highly technical.

It is, therefore, up to the doctors of medicine who know about these things to keep closely in touch with their representatives not only in Albany but in Washington also. Cooperation implies equal effort on both sides. No legislator can cooperate with an indifferent, silent, or uncommunicative profession. Let every member of this Society get in contact with his representative or senator often. This is an obligation that medicine will neglect at its own peril and that constitutes a disservice to the public.

Effective Cooperation

The seven general hospitals of Rochester, recognizing their responsibility to the community, have given, during the past year, a brilliant demonstration of the possibility and value of cooperative effort toward a single goal. A drive was organized through the Monroe County Medical Society to secure better treatment of pneumonia throughout the city. In the January issue of the Monroe County Bulletin, striking evidence of preliminary success was presented. Study of the mortality figures of cases treated in these seven cooperating hos-

pitals leaves a distinct impression of real achievement. It is difficult to quantitate the achievement since there are no figures available with which to compare those reported. Available figures on pneumonia mortality come, on the one hand, either from great centers where pneumonia is the object of intense study and special interest or from wide areas as reported by physicians and hospitals to the health authorities. The Rochester cooperative study represents, on the other hand, cases of pneumonia as admitted and treated in the general hospitals of a

large city Despite the lack of comparable data, a gross mortality of 10.7 per cent, with a mortality of 12.6 per cent in all adults, in cases of proved and typed pneumococcal pneumonia is impressive.

The spirit of friendly cooperation and mutual understanding developed during the first year of the cooperative study has led to a decision to continue this par-

ticular work and to a hope that the same underlying principle may be applied to other problems of general community interest and hospital responsibility. The men who have been able to bring this about deserve hearty congratulations on having established an unusual and particularly valuable method of approach to serious community problems.

NEW YORK CITY EXCISE TAX ON GROSS RECEIPTS

THE CITY OF NEW YORK

EMERGENCY REVENUE DIVISION

CORRESPONDENCE SECTION, BUSINESS TAX, ROOM 629
50 LAFAYETTE STREET, NEW YORK CITY
WORTH 2-4780

May 9, 1941

Medical Society of the State of New York
292 Madison Ave
New York, New York

Gentlemen:

You are hereby notified for the benefit of the members of your society that the New York City Excise Tax on Gross Receipts is due on June 15, 1941. The tax is imposed for the privilege of carrying on or exercising for gain or profit within the City of New York any trade, business, profession, vocation, or commercial activity during the period commencing July 1, 1940, and ending June 30, 1941, or any part thereof. Where a person subject to tax was engaged as described hereinabove during the whole of the calendar year 1940, he is required to measure the tax by the gross receipts for such calendar year.

In view of the foregoing, returns are to be filed by physicians on Form 41B and the gross receipts from the profession or vocation engaged in should be reported as Item 5 on Page 1 of the return. Profits from stock and bond transactions, interest received on bank deposits, notes, bonds, loans, etc., and dividends received on

stocks of domestic and foreign corporations need not be reported when the receipts therefrom constitute transactions of a strictly personal nature. In reporting the gross receipts no deduction may be taken for salaries and office expenses. The tax is to be computed at the rate of one-tenth of 1 per cent.

There is no exemption granted under the current Gross Receipts Tax Law. However, there is no tax imposed where the gross receipts from the profession or vocation engaged in do not exceed \$10,000 per annum. In such event, no return need be filed.

Returns must be filed on or before June 15, 1941, with the Bureau of City Collections in the borough in which the taxpayer maintains his office. A remittance for the total amount of tax due, drawn to the order of the City Collector, must accompany the return when filed. Tax blanks will be mailed to all taxpayers who have filed returns under prior laws.

Further information may be obtained from the Emergency Revenue Division, 50 Lafayette Street, Manhattan (WOrth 2-4780).

Very truly yours,

SAMUEL ORR
Special Deputy Comptroller

APPOINTMENTS IN REGULAR AND RESERVE MEDICAL CORPS, U S NAVY

HEADQUARTERS OF THE COMMANDANT THIRD NAVAL DISTRICT

FEDERAL OFFICE BUILDING, 90 CHURCH STREET, NEW YORK CITY

To the Editor

The Surgeon General of the Navy has announced that there are about 800 vacancies in the General Class of the Medical Corps Reserve, physicians under 35 years of age, and 100 vacancies in the Specialist Class. The greatest need in the Specialist Class is for radiologists and psychiatrists.

He has also recently sent out the following announcement relative to appointments in the Medical Corps of the regular Navy:

Examinations for Appointments in the Medical Corps

The next examination for appointments as Assistant Surgeon, U S Navy, Lieutenant (junior grade), Medical Corps, U S Navy, will be held at all major medical department activities on August 11 to 15, inclusive. Applications for this examination must be in the Bureau of Medicine and Surgery not later than July 15.

Applicants for appointment as Assistant Surgeon must be citizens of the United States, more

than twenty-one (21) but less than thirty-two (32) years of age at the time of acceptance of appointment, and graduates of a Class A medical school who have completed at least one year of intern training in a hospital accredited for intern training by the council on Medical Education and Hospitals of the American Medical Association

An examination for appointment as Acting Assistant Surgeon for intern training in a naval hospital accredited for intern training by the Council on Medical Education and Hospitals of the American Medical Association will be held at all major medical department activities on June 23 to 26, inclusive. Students in Class A medical schools who will complete their medical education this year are eligible to apply for these appointments, and if successful will receive their appointments approximately one month after the date of the examinations. Students in Class A medical schools who will have completed their third year of medical education this year are eligible to take this examination, and if successful will receive their appointments on or about July 1, 1942, after they have completed their medical education.

Applicants for appointment as Acting Assistant Surgeon for intern training must be citizens of the United States, more than twenty-one (21)

but less than thirty-two (32) years of age at the time of acceptance of appointment. Acting Assistant Surgeons are appointed for a period of eighteen months. After the appointee has served as an intern in a naval hospital for twelve months, he is eligible for and may take the examination for appointment as Assistant Surgeon, U S Navy.

A circular of information listing physical and other requirements for appointment as Assistant Surgeon and Acting Assistant Surgeon, subjects in which applicants are examined, application forms, etc., may be obtained from the Bureau of Medicine and Surgery, Navy Department, Washington, D C, upon request.

Assistant Surgeons and Acting Assistant Surgeons for intern training are appointed in the rank of Lieutenant (junior grade), Medical Corps, U S Navy. The pay and allowances for an officer of this rank total \$2,699 per year if he has no dependents and \$3,158 per year if he is married or has dependents.

The District Medical Officer of the Third Naval District at 90 Church Street, New York City can furnish further information about either the Regular or Reserve Medical Corps of the Navy.

Sincerely yours,

E C WHITE

MENTAL HYGIENE DIVISION

DEPARTMENT OF HEALTH, COUNTY OF SUFFOLK, RIVERHEAD, NEW YORK

May 15, 1941

To the Editor

Dr George M Lott has been appointed as director of the Mental Hygiene Division of the Suffolk County Department of Health.

He is a graduate of the University of Michigan with a degree of A B in 1922 and received his M D degree at the University of Colorado School of Medicine in 1928.

From August, 1928, to August, 1930, he was intern and resident at the Henry Ford Hospital at Detroit, Michigan. He was a resident of the Boston Psychopathic Hospital from September, 1930, to August, 1931. He was a Fellow in Psychiatry at the Institute for Child Guidance in New York City from July, 1931, to July, 1932, and during the same time was assistant physician to the Cornell University Out-Patient Clinic in the Department of Psychiatry.

From September, 1932, to September, 1936, he was director of the Bureau of Child Guidance and state psychiatrist for the State of Rhode Island. He was psychiatrist in the Bureau of Child Guidance of the Board of Education of the City of New York from September, 1936, to September, 1939, since which time he has been engaged in private practice and connected with the Long Island Home at Amityville, Long Island.

He is a diplomate of the National Board of Medical Examiners in 1930 and a diplomate of the American Board of Psychiatry and Neurology in 1936 and a qualified psychiatrist under the Mental Hygiene laws of New York State.

He is a member of the following professional societies: Fellow of the American Medical Association, American Psychiatric Association, American Orthopsychiatric Association, New England Society of Psychiatry, New York Society for Clinical Psychiatry, and National Educational Association.

Following the announcement that this service would be established in Suffolk County and would apparently be the first of its kind in a County Health Department, Dr Thomas Parran, surgeon general of the United States Public Health Service, wrote to the Department as follows:

"Please accept my heartiest commendation for this forward step in not only recognizing that to a large degree mental health is purchasable, but also because you have identified mental health as a public health problem and accept responsibility for such work in your organized health department. You are expressing an attitude which reflects mine in this matter and one which the Public Health Service intends to encourage among organized health agencies as vigorously as possible."

It is also interesting to note that the state commissioner of health, Dr Edward S Godfrey, deems the care and prevention of mental illness to be a proper function of health departments in this state and that state aid has been granted for this service in the same manner as other services which have long been recognized as routine functions of health departments.

Very truly yours,

A T DAVIS, M D
Commissioner of Health

Symposium on Medical Problems in National Defense

FROM THE VIEWPOINT OF THE ARMY MEDICAL OFFICER

CHARLES M. WALSON, Colonel Medical Corps, U S A, Surgeon Second Corps Area, Governors Island, New York

THIS subject permits a wide range for discussion. My comments on some of the problems that particularly concern all of us at this time will be as brief as possible.

Medical Department Officers

The Present War Department program calls for a Regular Army of 375,000. The National Guard, which has been called the first line of defense, has 225,000 men, and the selectees will number 800,000, so that the total strength of the United States Army will be 1,400,000 by July 1 of this year.

The Officers Reserve Corps has about 125,000 officers, and approximately one-fifth of this number are in the Medical Department. These include members of the Medical, Dental, Veterinary, Sanitary, and Medical Administrative Corps. The Medical Reserve Corps, which preceded the Line Reserve Corps, was established by act of Congress, April 23, 1908. In its infancy it contained few Reserve officers, but those chosen were the leading physicians of the medical profession. The influence and prestige these illustrious men contributed by their service to the Medical Department of the Army cannot be overestimated. Their action was the impetus for others to follow in their footsteps, and as a consequence the flower of the medical profession participated in the World War. We, the medical profession, are all proud of the magnificent record achieved in those eventful days.

It has been estimated that our Medical Department personnel requirements may be anywhere from 15,000 to 40,000 commissioned officers, depending upon the extent of troop mobilization. There are over 175,000 physicians in the United States, of whom nearly 115,000 are members of the American Medical Association. The Second Corps Area, comprising the states of New York, Delaware, and New Jersey, has a population of approximately 17,500,000. There are, within these three

states, over 33,500 physicians, 27,000 of whom reside in the State of New York. Of this number approximately 2,400 are members of the Medical Reserve Corps. In this Corps Area we have one doctor for about every 550 people, whereas in the remainder of the United States there is one doctor for every 800 people. In other words, there are approximately one and one-half times as many physicians per unit of population in this Corps Area as there are in the remainder of the U S.

Our initial medical officer requirements are approximately 6.5 for each one thousand men in the military service—a total of 9,100. Since we are now on a training program basis, we must draw about 6,800 medical officers from civilian and Reserve sources. The remainder of our medical officer requirements should be supplied from the Medical Department of the Regular Army. About 70,000 hospital beds will have to be made available for military personnel in station or camp hospitals, and an additional 14,000 beds will be required for general hospitals. We will need nearly 60 doctors for each one thousand hospital beds alone. In the Second Corps Area there should be at least 5,210 hospital beds.

One of the problems that face us today is how can we best meet our medical officer requirements? On April 1 of this year there were 3,631 Medical Department Reserve officers in this Corps Area. Of this number, 1,015 were either on extended active duty in the Army or awaiting orders. Our records in the Second Corps Area show that approximately 20 per cent of the medical officers physically examined have been found disqualified. Nearly every Medical Reserve officer in this Corps Area below the grade of Colonel has received notice to obtain a physical examination and hold himself in readiness for call to active duty.

Since January 1, 1941, for various reasons we have lost 279 Medical Reserve officers, more than half of these losses were due to resignations. Another 120 resignations are under consideration at the present time.

Read by invitation at the Annual Meeting of the Medical Society of the State of New York, Buffalo, New York, April 30, 1941.

than twenty-one (21) but less than thirty-two (32) years of age at the time of acceptance of appointment, and graduates of a Class A medical school who have completed at least one year of intern training in a hospital accredited for intern training by the Council on Medical Education and Hospitals of the American Medical Association.

An examination for appointment as Acting Assistant Surgeon for intern training in a naval hospital accredited for intern training by the Council on Medical Education and Hospitals of the American Medical Association will be held at all major medical department activities on June 23 to 26 inclusive. Students in Class A medical schools who will complete their medical education this year are eligible to apply for these appointments, and if successful will receive their appointments approximately one month after the date of the examinations. Students in Class A medical schools who will have completed their third year of medical education this year are eligible to take this examination, and if successful will receive their appointments on or about July 1, 1942, after they have completed their medical education.

Applicants for appointment as Acting Assistant Surgeon for intern training must be citizens of the United States, more than twenty-one (21)

but less than thirty-two (32) years of age at the time of acceptance of appointment. Acting Assistant Surgeons are appointed for a period of eighteen months. After the appointee has served as an intern in a naval hospital for twelve months, he is eligible for and may take the examination for appointment as Assistant Surgeon, U S Navy.

A circular of information listing physical and other requirements for appointment as Assistant Surgeon and Acting Assistant Surgeon, subjects in which applicants are examined, application forms, etc., may be obtained from the Bureau of Medicine and Surgery, Navy Department, Washington D C, upon request.

Assistant Surgeons and Acting Assistant Surgeons for intern training are appointed in the rank of Lieutenant (junior grade), Medical Corps, U S Navy. The pay and allowances for an officer of this rank total \$2,609 per year if he has no dependents and \$3,158 per year if he is married or has dependents.

The District Medical Officer of the Third Naval District at 90 Church Street, New York City, can furnish further information about either the Regular or Reserve Medical Corps of the Navy.

Sincerely yours,

E. C. WHITE

MENTAL HYGIENE DIVISION

DEPARTMENT OF HEALTH, COUNTY OF SUFFOLK, RIVERHEAD, NEW YORK

May 15, 1941

To the Editor—

Dr. George M. Lott has been appointed as director of the Mental Hygiene Division of the Suffolk County Department of Health.

He is a graduate of the University of Michigan with a degree of A.B. in 1922 and received his M.D. degree at the University of Colorado School of Medicine in 1928.

From August, 1928, to August, 1930 he was intern and resident at the Henry Ford Hospital at Detroit, Michigan. He was a resident of the Boston Psychopathic Hospital from September 1930, to August, 1931. He was a Fellow in Psychiatry at the Institute for Child Guidance in New York City from July, 1931, to July, 1932, and during the same time was assistant physician to the Cornell University Out-Patient Clinic in the Department of Psychiatry.

From September, 1932, to September, 1936, he was director of the Bureau of Child Guidance and state psychiatrist for the State of Rhode Island. He was psychiatrist in the Bureau of Child Guidance of the Board of Education of the City of New York from September, 1936, to September, 1939, since which time he has been engaged in private practice and connected with the Long Island Home at Amityville, Long Island.

He is a diplomate of the National Board of Medical Examiners in 1930 and a diplomate of the American Board of Psychiatry and Neurology in 1936 and a qualified psychiatrist under the Mental Hygiene laws of New York State.

He is a member of the following professional societies: Fellow of the American Medical Association, American Psychiatric Association, American Orthopsychiatric Association, New England Society of Psychiatry, New York Society for Clinical Psychiatry, and National Educational Association.

Following the announcement that this service would be established in Suffolk County and would apparently be the first of its kind in a County Health Department, Dr. Thomas Parran, surgeon general of the United States Public Health Service, wrote to the Department as follows:

"Please accept my heartiest commendation for this forward step in not only recognizing that to a large degree mental health is purchasable, but also because you have identified mental health as a public health problem and accept responsibility for such work in your organized health department. You are expressing an attitude which reflects mine in this matter and one which the Public Health Service intends to encourage among organized health agencies as vigorously as possible."

It is also interesting to note that the state commissioner of health, Dr. Edward S. Goddard, deems the care and prevention of mental illness to be a proper function of health departments in this state and that state aid has been granted for this service in the same manner as other services which have long been recognized as routine functions of health departments.

Very truly yours,

A. T. DAVIS, M.D.
Commissioner of Health

Oath of Office There are some instances now where physicians are serving in the capacity of enlisted men because of failure to initiate papers promptly for a commission in the Reserve Corps. If a doctor or dentist in your community does not hold a commission in the Reserve Corps and he is called before a local Selective Service Board and placed in Class I-A, he should immediately report with such information to the Executive Officer of the Military Area in which he resides and make application for a commission in the Reserve Corps.

At the present time there are several Medical Corps vacancies in the authorized War Department procurement objective for this Corps Area. When all War Department vacancies have become filled, the doctor selected in Class I-A will be required to serve as an enlisted man when inducted unless a vacancy in the Medical Corps becomes available. The Dental, Veterinary, and Sanitary Reserve Corps do not have a vacancy at this time, and those who are inducted into the Army serve in the status of enlisted men until a vacancy exists. It is considered highly advantageous for doctors who are eligible for service under the provisions of the Selective Service Act to make application for a commission in the Medical Reserve Corps at once, if eligible.

I would also strongly recommend that all senior medical students make application for a commission in the Reserve Corps immediately and not wait until they have been graduated in medicine. If eligible, a senior medical student can be granted a commission as First Lieutenant in the Medical Reserve Corps of the Army immediately upon graduation from fully accredited medical schools in the United States, even before he appears before a State Board and has secured a license to practice medicine. He should understand that accepting a commission in the Reserve Corps will not interfere with his internship. As soon as commissioned he should present his letter of appointment to his local Selective Service Board for reclassification. The most logical time for a Reserve officer to serve his year on extended active duty in the military service is upon the completion of his internship before he has established himself in civil practice.

We receive many requests for exemption from active duty of Medical Reserve officers who are serving a residency in some hospital. Each such application is carefully investigated, and wherever it is possible to do so we

grant a deferment. Our action depends upon many factors, including the exigencies and demands of the service. It should be clearly understood that a physician is not exempt because he is serving a residency.

Affiliated Hospitals

The War Department has authorized a certain number of affiliated units sponsored by civilian hospitals. The object of such affiliation is to provide integrated hospital units with qualified, coordinated personnel for early active military duty in the event of a national emergency.

A senior Reserve officer for each unit will, upon approval of the Surgeon General, be designated as Unit Director. He will be charged with the peacetime organization, administration, and training of the units. The remaining appointments will be in grades appropriate for the position to which the individuals are to be assigned as authorized in War Department Tables of Organization. These appointments will be restricted to individuals who are (1) members of the staffs or faculties of, or associated with, sponsoring institutions, (2) between the ages of 23 and 55 years, and (3) physically qualified for appointment. Prior to mobilization of the unit, an officer of the Medical Corps, Regular Army, will be assigned to each affiliated unit as Commanding Officer to effect its mobilization.

Physical Examination of Selective Service Registrants

The Selective Service Regulations prescribed by Executive Order No. 8570, signed by the President, October 18, 1940, describe the organization, administration, registration, classification, selection, delivery, induction, finance, and physical standards pertaining to Selective Service. The physical standards prescribed for local and medical advisory boards for Selective Service are, of course, precisely the same as MR 1-9, which is used by Army Induction Boards. Local doctors throughout the Corps Area have generously given their services without charge in the conducting of physical examinations of registrants at the place each local board functions. There exists no group more patriotic than the American physician who faithfully performs this work, the nature of which at times undoubtedly creates unjust criticism.

In connection with this work the State Council Committees on Medical Prepared-

In so many instances, members of the medical profession say they want to enter the service only in case of war. They fail to realize we will soon have an Army of 1,400,000 men who must have medical care and that our Medical Department personnel needs training just as much as the remainder of the Army.

Late last summer all Medical Reserve officers filled out two questionnaires. One asked whether they were available for active duty and, if not, how much deferment was desired, giving reasons for deferment. The other questionnaire requested information regarding the type of practice and the specialty pursued, if any, by each officer. In addition, we have a file of each Medical Department officer which shows his military record, including previous assignments and duties performed, promotions, efficiency record, etc. These are the three chief sources of information used at the Corps Area Surgeon's Office in determining our recommendations pertaining to active duty assignments.

When an officer has been notified that he has been selected for active duty he should report at once for his physical examination. This is important because he may be found physically disqualified. In that case he would be spared inconvenience and disruption of his practice.

The assignment of Medical Department officers by the Second Corps Area is not limited to the Second Corps Area Service Command. Our requisitions call for medical personnel for the following additional places: tactical units of the First Army, First and Fourth Corps Area Service Command units, Army Medical Center, Medical Field Service Training School at Carlisle Barracks, Medical Replacement Centers, General Hospitals, and periodical requests for foreign service.

You will recall that a Medical Preparedness Committee was appointed by the American Medical Association House of Delegates at the request of the Surgeon General of the Army, Navy, and the United States Public Health Service. This committee and the Division of Medical Sciences of the National Research Council have materially assisted in the classification and procurement of physicians for the Army. The American Medical Association maintains a roster of civilian physicians, classified as to professional specialties and proficiency, who have agreed to accept commissions in the Army of the United States when needed for immediate active duty during a national emergency. The Surgeon General of the Army has a medi-

cal officer of the Regular Army on duty at the Headquarters of the Sixth Corps Area as a representative of his office in all matters pertaining to the Medical Reserve Corps and the American Medical Association.

Medical Department officer vacancies in a Corps Area which cannot be filled by the detail of a qualified Reserve officer in the Corps Area are reported to the War Department, such vacancies are filled from another Corps Area or by the War Department if an officer is available. If a qualified Reserve officer cannot be found, the Surgeon General notifies his representative at Headquarters, Sixth Corps Area, stating the physician's qualifications needed to fill the specific vacancy. The Surgeon General's representative will then secure the recommendations of the American Medical Association and forward the information required to the appropriate Corps Area Commander. The physician selected is then requested to appear for a physical examination. If found physically qualified, the physician will be requested to furnish a properly completed application for a commission. No appointments are made of applicants over 55 years of age.

We receive frequent inquiries relative to interns in civilian hospitals. An intern holding a commission in the Medical Reserve Corps is not required to enter on active duty before completing his year's internship. There are a few who have a longer internship, so far in this Corps Area we have not called any of these physicians to active duty. If it should become necessary, an effort would be made to assign them to a large hospital where they could finish their rotating internship and receive credit for same. In view of the anticipated annual demand for approximately 4,000 Medical Reserve officers to replace those who have completed twelve months' training and service, further deferment will depend on contingencies at that time. When an intern makes application for commission, he must sign a statement to the effect that he will accept one year of extended active duty and not request resignation on account of dependents.

It should be clearly understood that a doctor within Selective Service age requirements who is not serving an internship is not exempt from Selective Service. All physicians of draft age eligible for call under the Selective Service Law should make application for a commission in the Medical Reserve Corps immediately. It takes some time to complete all papers and actually obtain the

Oath of Office There are some instances now where physicians are serving in the capacity of enlisted men because of failure to initiate papers promptly for a commission in the Reserve Corps. If a doctor or dentist in your community does not hold a commission in the Reserve Corps and he is called before a local Selective Service Board and placed in Class I-A, he should immediately report with such information to the Executive Officer of the Military Area in which he resides and make application for a commission in the Reserve Corps.

ness in this Corps Area were requested to recommend the names of qualified specialists for the induction stations' medical examining boards. These Induction Stations are now located at the following places: Buffalo, Syracuse, Albany, Manhattan and Queens boroughs, N Y, and Newark and Trenton, N J.

The allotted strength of Medical Department personnel is that prescribed by MR 1-7. Originally it was considered that for an average of 200 men per day the medical examining board should consist of 12 officers and 18 enlisted men. This personnel was later increased by providing one neuropsychiatrist for each 50 inductees. In addition, representatives of the upstate New York Department of Health, New York City Department of Health, New Jersey state and local health services, and the State Department of Health in Delaware provided expert physicians to interpret x-rays of the chests of all selectees reporting at induction stations in the Second Corps Area. So, at the present time, the requirements for an induction station for 200 men are 16 medical officers, 1 dental officer, and 22 enlisted men or civilian employees.

The total number of registrants received at induction stations in the Second Corps Area as of March 31 was 76,406. Of this number, 64,398 were accepted and 11,991, or 15.7 per cent, have been rejected. The causes for rejection during each ten-day requisition period may be classified under nine main headings (Table 1).

Table 1 includes the causes for rejection under each heading for this Corps Area based on each requisition period, samples of approximately 1,000 men in the early period of examination in all Corps Areas, and, for comparative purposes, the last line indicates rejections in an early period during the World War.

A study of this table shows considerable variation in rejections within the Second Corps Area during the early and later re-

quisition periods in contrast with rejections during the World War. These figures should be interpreted as only showing a trend. Conclusive data will be unavailable until a complete analysis has been made by the Surgeon General of the Army.

Our experience in this Corps Area indicates there has been a drop in dental rejections from 27.6 per cent in the first period to 12.9 per cent in the last period. This is probably due to a better understanding of the dental requirements as processing continued. Dental rejections in the World War during the early stages were approximately 7 per cent. Rejections for defects of eyes, mental abnormality, and as a result of hernia have been consistent throughout and agree substantially with figures from the World War.

The average rejections for defects of the ear in this Corps Area are slightly less than 9 per cent, which is about double the percentage (4.6 per cent) for the early World War.

Rejections for heart defects are 6.2 per cent, which is less than half that of the comparable World War period.

Rejection for lung defects during the early part of the last war was 10.9 per cent, and so far in this Corps Area it has been 8.5 per cent or 2.4 less, notwithstanding the fact that all registrants are given an examination that includes an x-ray of the chest. Approximately 1 per cent are rejected because of x-ray findings. With the exception of the Second and Third Corps Areas, the rejection for lungs was low, the average for all Corps Areas being 3.8 per cent.

Musculo-skeletal and feet defects have averaged more than 9 per cent as compared with World War figures of nearly 17 per cent.

Venereal rejections in this Corps Area during the first requisition period were 5.4 per cent, while in the last requisition period in March it was 20.4 per cent. The increase in rate began in the fifth requisition period, when the percentage was 14.4, and reached

20.4 per cent in the seventh period the last week in March. It was in the fifth period that colored men were included among the selectees. This increase may be partly due to a change made in MR 1-9 and a delay in the information reaching examining physicians, or a misinterpretation of MR 1-9. During a similar period of the World War the venereal rejections were slightly over 4 per cent.

The average total rejections in this Corps Area, including the seventh requisition period ending March 31, were 15.7 per cent as compared with 16.7 per cent for a general average in all Corps Areas during the first requisition period and in contrast to 11.6 per cent in the early stages of the World War.

"The Prehabilitation of Registrants—a Plan for Rendering Registrants Fit for Examination and Service" has been offered by Selective Service Headquarters on page 1777 of the *Journal of the American Medical Association*, April 19, 1941, under the heading of "Medical Preparedness." It is suggested that every physician and dentist read this article.

"The plan provides that (1) registrants familiarize themselves with the physical standards required, (2) registrants apply to their local physicians and dentists if they fall short of the stipulated standards, (3) family physicians and dentists correct defects if they are remediable, and (4) registrants carry certificates of prehabilitation to local and induction boards at the time they present themselves for examination.

"The purposes of this plan are (1) to afford the registrant participation in his own prehabilitation, (2) to select more suitable men and increase the number of inductions, (3) to improve national morale by decreasing the number of rejections, (4) to cultivate in the registrants the spirit of self-reliance, initiative, and patriotism, and (5) to effect prehabilitation through maintaining the normal relationship of the patient to his family doctor and dentist."

Medical Supply

As science and civilization progress the question of supply becomes more intricate. Cognizant of that fact, the War Department plan for medical supply preparedness has been going on since the last war. Planning for the mobilization of the medical resources of the country is one of the primary and fundamental functions of the Medical Department.

An Army's movement and its very existence can continue only so long as supplies and materials are adequate, and the quantities that

represent adequacy are almost beyond one's comprehension. The average layman thinks of medical supplies in terms of pills, hot water bottles, and the ordinary items found in drug stores. The fact is that the Medical Department buys, stores, and issues about 5,500 different articles, which range in variety from an upright steam boiler to carpet tacks. The Medical Supply Officer at the New York Depot tells me that at this time he is completing a program of assembling and shipping a total of 98 hospitals totaling 27,000 beds. These hospitals range in size from 25- to 1,000-bed capacity, and each bed represents approximately 600 pounds of auxiliary equipment.

Supplies for the Medical Department are vital. They are essential in the care of troops. When a recruit arrives at camp, he is clothed. Hence, if a uniform cannot be supplied immediately by the Quartermaster, the soldier will not die of exposure. If the Ordnance Department does not have guns, he must postpone shooting, if airplanes are not available, he cannot be taught to fly. The lack of these facilities does not produce individual hardship, epidemics and death. However, a recruit, upon arriving at camp, is subject to disease and injury, and it is imperative that the Medical Department have available appropriate equipment and supplies for his needs. We must always be prepared to meet any contingencies that affect the soldier's life or health.

Colonel Dawson, the officer in charge of the Medical Section of the New York General Depot, tells me that at the beginning of the present emergency the New York Medical Depot had approximately 550,000 square feet of floor space, spent an annual sum of around \$1,500,000, and shipped out about 500 tons of supplies per month. At present the floor space totals 1,400,000 square feet, expenditures since September 1, 1940, were \$32,000,000, and outgoing shipments exceed 3,500 tons per month, with incoming tonnage at least equaling this figure.

Time will not permit me to describe herein the many new items of equipment and supplies being made available for field use—such as blood plasma made from blood collected by the Red Cross and prepared by a manufacturer in units equivalent to a pint of blood, an anesthetic solution, already mixed ready for use in dental surgery, morphine in solution under nitrogen pressure for automatic use from container, individual ointment packets made out of soft gelatin capsules for

various prophylactic purposes, viz, venereal diseases, scabies, etc

Professional

The Medical Department of the Army must furnish the highest standard of service for all military personnel. The cooperation of civilian agencies in meeting these requirements is of the greatest importance. For this purpose, early in 1940, the Surgeon General of the Army and Navy requested the Division of Medical Sciences of the National Research Council to establish committees that might act in an advisory capacity to the Medical Department. As a result, at the present time there are seven main committees functioning—namely (a) Committee on Chemotherapeutic and Other Agents, (b) Committee on Transfusion, (c) Committee on Medicine, (d) Committee on Surgery, (e) Committee on Aviation Medicine, (f) Committee on Neuropsychiatry, and (g) Committee on Information. In addition, there are at least forty subcommittees connected with these committees. All are concerned with some vital medical problem, and their findings are circulated to the appropriate medical personnel.

For example, the Committee on Chemotherapeutic and Other Agents, in compliance with a request from the Surgeon General, summarized the present status of chemotherapy with a view to its application in the treatment of military personnel. An outline of their opinions and recommendations concerning infections and infectious diseases was published in a circular letter by the Surgeon General as a general guide to medical officers so that this committee's findings could be used at their discretion with due consideration of all other factors that may be presented by each individual patient.

Aside from the care of the sick and injured, the Medical Department of the Army has always been concerned about the prevention of sickness and injury. It has been especially proud of its achievement in that role. I refer particularly to environmental sanitation, water supply, sewage disposal, antimalarial work, control of venereal diseases, and inspection of food and meat.

Immunization Against Infectious Diseases in the United States Army

Selective Service registrants for our Army are critically inspected and tested. They must meet high standards physically, mentally, and morally. Those accepted are be-

lieved to be able to stand up under a year's strenuous military service and ten years in the Reserve Corps of the Army. The soldier is instructed in personal hygiene and is required to practice its principles. He is properly housed, provided a well-balanced diet, supplied adequate clothing, and is required to take supervised physical exercises. An efficient system of environmental sanitation gives him the best possible protection against communicable diseases. If he becomes sick or injured, he is given the best care possible in a modern hospital. In spite of all these measures a higher sick rate is always expected in recruits. This is especially true during the season when respiratory diseases are prevalent or in the field when men are not well disciplined.

Hemisphere defense necessitates the sending of our troops to varied climates where they are exposed to a great variety of diseases. The Medical Department of the Army has constantly been on the alert to perfect all plans to meet any contingencies that will affect the soldier's health. Military preventive medicine is one of the most important factors we can depend upon for accomplishing this task.

The accomplishment of prophylactic immunization against infectious diseases is particularly effective in Army troops. Army organization and administration make the carrying out of adopted immunization procedures a simple matter. Experience has shown that troops can be thoroughly immunized against smallpox, typhoid fever, and tetanus. Our Army has been effectively vaccinated against smallpox and typhoid fever for many years. During the World War tetanus antitoxin was used routinely as a prophylactic. As a result, there were only 36 cases of tetanus associated with 176,000 battle injuries. It has been reported that the French used toxoid immunization during the current war with no serious reactions and not a single case of tetanus. Active immunization against tetanus by vaccination with tetanus toxoid is being performed on military personnel when authorized by the War Department. Civilian employees subject to field service with the Army and others at military stations are privileged to take this vaccination. The first dose can be given concurrently with triple typhoid and smallpox vaccine. The Army is using liquid tetanus toxoid (plain), prepared according to specifications approved by the United States Public Health Service and the Surgeon General of the Army.

In addition to the above-mentioned vaccines, diphtheria toxoid or scarlet fever toxin may be used in localized outbreaks of diphtheria and scarlet fever among young recruits.

Our troops may be sent to localities where they have to be vaccinated against yellow fever, cholera, plague, and typhus fever. As a matter of fact, a vaccine that has been manufactured since 1936 by the Rockefeller International Health Board, consisting of an attenuated, living strain of yellow fever virus maintained by cultivation in the living chick embryo, is available for our troops that are sent to regions where yellow fever may occur.

Anticholera vaccines have been used for many years. The killed suspension of the *Vibrio* as used in Japan and India apparently affords protection. If our troops become exposed to epidemic cholera, a vaccine should be used. Plague, which has killed millions of individuals, at times has spread over the world. As late as 1923 it was estimated that there were 250,000 cases of plague distributed throughout the world. Endemic foci of rodent plague are known to exist in this country. This so-called "sylvatic" type of plague has been found in practically every state west of the Continental Divide. If our troops were exposed to epidemic plague, either the bubonic or pneumonic type, the use of a bacterial vaccine against the disease should be carefully considered.

Typhus fever is a wartime disease. The delousing of troops is a valuable control measure but does not give sufficient protection during an epidemic of the disease. Vaccines as a protective measure are believed effective as the result of animal experimentation, and arrangements have been made to manufacture it in large quantities should it be required.

The vaccine prepared by the International Health Board from strains of influenza and distemper viruses grown together in tissue culture is now being used for the prevention of influenza in man. This may become the greatest weapon for the control of this disease in the Army.

Since 1936 the Army has been interested in determining the prophylactic value of certain pneumococcal polysaccharide solutions against pneumonia. The results so far reported are encouraging. Specific agents are needed for the protection of troops in the field against such diseases as measles, mumps, meningitis, poliomyelitis, encephalitis, gas gangrene, malaria, relapsing fever, oryza fever, and the venereal infections.

Morbidity and Mortality Statistics in the Second Corps Area

The average military strength in the Second Corps Area from September 21, 1940, to March 28, 1941, a period of 27 weeks, was 53,170. The following communicable diseases occurred: 14,988 cases of common respiratory disease, including influenza, 168, primary pneumonia, 9, epidemic meningitis, 149, measles, 188, scarlet fever, 912, German measles, 562, gonorrhea (508 of which were new), and 79, syphilis (21 of which were new).

During this period there were 49 deaths. Of this number, 25 were due to violence, viz., automobile accidents 15, gunshot wounds 3, airplane accidents 2, carbon monoxide poisoning 1, drug poisoning 1, burns 1, fractured skull 1, suicide by jumping from a high place 1. 9 deaths were due to cardiovascular renal disease, the remaining were from miscellaneous causes.

There were only 168 cases of primary pneumonia during this period when respiratory and acute communicable diseases were unusually high throughout the country. The fact that there was only 1 death among this group and no deaths among 9 cases of epidemic meningitis speaks well for modern chemotherapeutic measures. Credit should also be given to the constant vigilance maintained by the Medical Department personnel, which included daily inspections, observing all questionable sick patients at the unit infirmary, sending to the hospital all men with temperatures of more than 100 F and any others if in doubt about the appropriate disposition in each case, and careful medical care and nursing at the hospital. All these factors contribute to our low sick and death rate.

A few years ago there used to be reported about 500,000 cases of pneumonia of all forms in the United States each year, with approximately 100,000 deaths. The death rate then from pneumonia was exceeded only by heart disease and cancer. Further significance in this connection bearing on the use of the sulfonamide group of drugs can be appreciated by considering some of the last World War statistics. There were 2,370 deaths from measles, most of which were due to complicating streptococcal infections, 4,831 admissions for cerebrospinal meningitis with 1,836 deaths, 45,774 cases of lobar pneumonia with 10,145 deaths, a fatality of over 22 per cent. The total man-days lost to the Army from gonorrhea in the World War were 3,903,303. Based on recent tables where the results of various

chemotherapeutic agents are carefully reported, checked, and analyzed, it appears that more than 65 per cent of gonorrhea cases are symptom-free within one week under sulfa-thiazole treatment

Extra Cantonment Sanitation

During the past year it was my privilege to observe the splendid coordination of effort and cooperation given the Army Surgeon by the United States Public Health Service and the New York State Health organization representatives not only in the planning stage of the First Army Maneuvers but while the maneuvers were in progress. It is properly recognized that reciprocation in this matter is equally important for the health of the Army and the civilians in the community concerned.

The above-mentioned agencies are using their resources in safeguarding the health of military personnel by suitable measures of extra cantonment military sanitation in the vicinity of maneuver areas and of Regular Army stations.

The control of venereal diseases continues to be one of the more important health problems for both the military and civilian authorities. The War Department, recognizing the seriousness of the venereal disease menace, sent a letter to the commanding generals of all corps areas and departments, citing the joint agreement between representatives of the Surgeon Generals of the Army, Navy and United States Public Health Service, with a view to initiation of measures for the purpose of reducing the spread of venereal diseases. The American Social Hygiene Association, together with many other voluntary agencies, is rendering a great service to this country under the provisions of the agreement referred to. This joint agreement was as follows:

It is recognized that the following services should be developed by state and local health and police authorities in cooperation with the Medical Corps of the United States Army, the Bureau of Medicine and Surgery of the United States Navy, the United States Public Health Service and interested voluntary organizations:

(1) Early diagnosis and adequate treatment by the Army and the Navy of enlisted personnel infected with the venereal diseases.

(2) Early diagnosis and treatment of the civilian population by the local health department.

(3) When authentic information can be obtained as to the probable source of extramarital venereal disease infection of military or naval personnel, the facts will be reported by medical officers of the Army or Navy to the state

or local health authorities as may be required. If additional authoritative information is available as to extramarital contacts with diseased military or naval personnel during the communicable stage, this should also be reported.

(4) All contacts of enlisted men with infected civilians to be reported to the medical officers in charge of the Army and Navy, by the local or state health authorities.

(5) Recalcitrant infected persons with communicable syphilis or gonorrhea to be forcibly isolated during the period of communicability, in civilian populations it is the duty of the local health authorities to obtain the assistance of the local police authorities in enforcing such isolation.

(6) Decrease as far as possible the opportunities for contacts with infected persons. The local police department is responsible for the repression of commercialized and clandestine prostitution. The local health departments, the State Health Department, the Public Health Service, the Army, and Navy, will cooperate with the local police authorities in repressing prostitution.

(7) An aggressive program of education both among enlisted personnel and the civilian population regarding the dangers of the venereal diseases, the methods for preventing these infections, and the steps that should be taken if a person suspects that he is infected.

(8) The local police and health authorities, the State Department of Health, the Public Health Service, the Army, and the Navy desire the assistance of representatives of the American Social Hygiene Association or affiliated social hygiene societies or other voluntary welfare organizations or groups in developing and stimulating public support for the above measures.

General Reynolds, in his presidential address on "Our Medical Preparedness for Modern War," before the Association of Military Surgeons of the United States at Cleveland, Ohio, in the fall of 1940, stated: "Prostitution must be recognized as a Fifth Column in our midst to be dealt with accordingly. Without restraint the forces of prostitution can decimate a military command. These forces strike the moment mobilization and concentration begin and hang on the flanks of the forces as they move from one theater of operations to another. Modern ways of life have changed the tactics of prostitution to keep it current with the changes of the methods of war. As Colonel Dunham puts it 'Prostitution has been motorized while the Army has become mechanized.' The operations of a mechanized force cover a wide territory, calling for a more universal cooperation by local health and police officers with military commanders."

Conclusion

Time will not permit even a mention of many phases of our tremendous task, in-

cluding those pertaining to administration, planning, training, tactical field problems, and the recent advances made in war medicine and surgery. While there are many unsolved medical problems that are a challenge to the medical profession, the outlook for the welfare of every soldier participating in the present National Emergency is better than ever before. There still remains, however, an opportunity for patriotic service of vital importance in the interest of National Defense by the members of our profession.

COMMUNITY HEALTH IN AREAS ADJACENT TO MILITARY POSTS AND IN DEFENSE INDUSTRIES

ALBERT E. RUSSELL, M D, F A C P, Governors Island, New York

THE present program for national defense has focused our attention on the many problems of public health and physical fitness. More than ever before the nation has recognized health as an essential element of preparedness. This is attested to by the phrase "maintenance of public health, safety, or interest" which is used repeatedly throughout the Selective Training and Service Act of 1940. Surgeon General Thomas Parran, in an address before the State and Territorial Health Officers in Washington, D C, on September 16, 1940, said in part "The most impelling problem which we face today is that of maintaining the safety of this country and its institutions. For their aggressive defense, we are gearing up governmental methods, mobilizing resources, and manpower."

"For the first time in all history, world events have thrust upon us the concept of a total war. In preparing for a total defense, all factors ultimately rest upon the one fundamental resource of the country, *manpower*. Medicine and public health, through the centuries, have been devoted to the conservation of manpower and its socially constructive use."

The Federal Government has planned a closer coordination of health activities to pro-

mote national defense than we have known before. We have now a coordination of civilian health problems with social welfare, children's problems, nutrition, and other consumer interests under one of seven members of the Advisory Commission of the Council of National Defense.

Health of the Workers

Industrial mobilization and expansion coincide with military mobilization and expansion. Although we have made progress, we are still far from solving all the long-time problems associated with occupational disease, accidents, and physical impairment among workers in ordinary times. The importance of industrial production in the United States has never been so great as it is today. It is the prime factor that will decide our future as a Democracy as well as that of our neighbor nations. It behooves us, therefore, to give serious thought and concise action in the matters of health of the men and women in our industries today.

The great and rapid industrial expansion has brought new and hazardous processes in addition to an augmentation of the old ones already known to us. Federal, state, and local health departments are taking steps to meet the present-day needs. The knowledge of industrial medicine and safety must now be applied vigorously, and careful watch for new hazards must be made. More than thirty state industrial hygiene units have been es-

Read by invitation by Roger E. Heering, M.D., M.P.H., Passed Assistant Surgeon, United States Public Health Service, at the Annual Meeting of the Medical Society of the State of New York, Buffalo, April 30, 1941.
Senior Surgeon, United States Public Health Service Liaison Officer, Army Second Corps Area, Fort Jay

established during the past five years, almost entirely with Federal funds from Title VI of the Social Security Act. These consist of an organization nucleus that is not entirely adequate to meet the present crisis. These units have their problems, and chief among these are lack of sufficient numbers of personnel with proper training for their jobs. Back of this, in many instances, is the lack of funds to employ trained personnel and to offer them security in their positions. The newness of industrial hygiene work in state health departments is perhaps the reason why funds have not been provided by the legislatures of the respective states. These units have not had sufficient time to prove their worth and thereby make it easier to obtain necessary funds. Now these units are called upon to function to the fullest extent of their abilities. The Federal Government is giving further help by providing funds and by assigning personnel to assist in this vital program.

Another problem in connection with the health of workers in defense industries is the shortage of physicians who are trained for industrial medical service. These men are important to industry, for they are the ones who must take care of the injured. They see those workers who are ill with infectious diseases, refer them to their own physicians, and notify the health officer. Early recognition and isolation are important. The industrial physician is first to recognize occupational diseases, and it is his duty to notify the industrial hygiene unit of the State Health Department. To meet the shortage of this important group of physicians it is necessary to coordinate postgraduate training with the medical societies, medical schools, and health departments. Industrial medicine is one of the newest specialties—therefore the shortage of physicians in this important field.

Health in Local Communities

The health in local communities is of great importance in national preparedness. This importance has a special emphasis in those communities where defense industries are located and also in those adjacent to military posts. For almost every worker there is attached a family, the health and welfare of which are the responsibility of the local, state, and federal health authorities. Workers must be treated as a part of the social structure, the basis of which is the family, and any health program that is aimed at him must include not only those with whom he works but also those with whom he lives and plays

We all agree that we are interested in preserving the health of the worker if only for the sake of his usefulness in our national scheme of defense activities. However, we cannot isolate the worker from his immediate associates, we cannot overlook the necessity of making him aware of his responsibility in the effort to prevent and check the spread of infectious diseases in his immediate environs.

In this connection we must also consider the problem of housing of workers and their families. There are always great health and social problems brought about by large population shifts. The lack of adequate housing complicates and intensifies these problems. The great expansion of industries and also mobilization of troops have brought to us many of these situations.

There exists a shortage of skilled workers throughout the defense industries. Increased production has resulted in placing a greater burden on the physical capacities of the individual skilled worker. Since this situation exists, it becomes imperative that health hazards be reduced to a minimum. It is not possible to concentrate the problem of control of communicable disease on industrial groups to the exclusion of the surrounding communities. The workers are already grouped together by the very nature of their occupations and are, consequently, more easily reached than the bulk of our civil population. Health education carried to industrial communities will have far-reaching effects. This is particularly true in the case of venereal diseases. The burden of organized activity to maintain the health in industrial and military areas must be shared equally by local official agencies, municipal administration, and employers.

Special Health Problems

Large population shifts may introduce a diversity of special health problems. Many of these seem rather remote on casual examination, however, when considered in their fullness they take on a different perspective. One of these is malaria. There are many places where mosquitoes are prevalent which are capable of transmitting this disease. Workers migrating from sections where malaria is prevalent may well serve as a reservoir of infection. Also, troops returning from the Canal Zone and other tropical areas may also become sources of infection. There was a recent outbreak in a neighboring state resulting in 110 cases of malaria traceable to a boy who had been in a CCC camp in the South.

Therefore, it is easy to see the necessity for efforts to control mosquito breeding

Water and Sewage Facilities

The rapid and extensive increase in population of small towns and villages has, in many instances, overtaxed the water and sewage facilities. Frequently, the local government has not been able to effect an augmentation of these services to meet the needs. In some situations it may appear wasteful to spend large sums to provide services that may be in demand only temporarily. However, surveys reveal that in many communities water and sewage disposal facilities are already operating at more than efficient capacity. Thus, the present emergency provides an impetus for the expansion of facilities for which the need has been existent for some time. In any event, we cannot afford halfway measures when the health and welfare of workers vital to the national defense are at stake. That the Federal Government takes this position is evidenced by the fact that, where necessary, local funds will be augmented by Federal aid.

Milk and Other Food Supplies

The transmission of disease through milk and other foods is not new to us. The increased demands for milk should be accompanied by increased vigilance. Universal pasteurization must be practiced to provide safety in this regard.

It might be well to mention here that the Public Health Service, Federal Security Agency, and the Bureau of Dairy Industry, United States Department of Agriculture, have approved and recommended for adoption by states and communities a milk ordinance and code to encourage a greater uniformity of milk control practice in the United States.

This ordinance and code embodies the best information at present available on milk control legislation, but it should be subject to change as improvements are developed.

The source and handling of other food supplies must have adequate supervision. Fortunately, much has been accomplished in this field already, however, vigilance must be maintained.

Medical and Hospital Service

The rapid growth of small villages into boom towns has brought about need for adequate medical and hospital services. In some of these communities no hospitals exist. Hospital service cannot be provided on short notice.

It is also costly to provide and maintain. Coordination of hospital and medical facilities must be made, and transportation units of ambulances must be organized to meet the local needs.

There is also a shortage of nurses and laboratory technicians. Intensive courses would provide more technicians. Nurses' courses are necessarily longer. Here again, coordination of available talent with the needs is extremely necessary.

Venereal Diseases

At no time in our history has the necessity for the control of venereal diseases been so imperative. The needless loss of millions of days by troops during the last war because of venereal disease must not be repeated at this time. So much progress has been made in the field of venereal disease control that we now have weapons never available to us before. Principle among these is education. It must be extended and applied in every national endeavor.

The military authorities have facilities for education and extension of activities in this field, however, the sources of infection of troops are outside the military posts and, therefore, beyond the control of military authorities. This places the burden of venereal disease control squarely on our shoulders. It is a great responsibility and one in which all must participate. The health officer must assume the leadership and have the support of local physicians and the law enforcement agencies. We are not concerned with the prevention of infection only in troops but also in the skilled and unskilled workers who are so vitally important in our scheme of national defense. Therefore, venereal disease control must be a vital part of the general health program.

Every state now furnishes a free laboratory diagnostic service to all physicians. Expensive drugs for the treatment of patients are available to all doctors. In 2,887 clinics competent diagnostic and treatment service is available, in most of them, epidemiologic investigations are made to seek out the sources of infection and bring them under treatment. The private physician can render valuable service in the control of venereal disease by promptly reporting the infectious cases and, if necessary, asking for their quarantine. This will save many lost working days to our vital industries by preventing the spread of these diseases.

Prostitution must not be tolerated. It has

tablished during the past five years, almost entirely with Federal funds from Title VI of the Social Security Act. These consist of an organization nucleus that is not entirely adequate to meet the present crisis. These units have their problems, and chief among these are lack of sufficient numbers of personnel with proper training for their jobs. Back of this, in many instances, is the lack of funds to employ trained personnel and to offer them security in their positions. The newness of industrial hygiene work in state health departments is perhaps the reason why funds have not been provided by the legislatures of the respective states. These units have not had sufficient time to prove their worth and thereby make it easier to obtain necessary funds. Now these units are called upon to function to the fullest extent of their abilities. The Federal Government is giving further help by providing funds and by assigning personnel to assist in this vital program.

Another problem in connection with the health of workers in defense industries is the shortage of physicians who are trained for industrial medical service. These men are important to industry, for they are the ones who must take care of the injured. They see those workers who are ill with infectious diseases, refer them to their own physicians, and notify the health officer. Early recognition and isolation are important. The industrial physician is first to recognize occupational diseases, and it is his duty to notify the industrial hygiene unit of the State Health Department. To meet the shortage of this important group of physicians it is necessary to coordinate postgraduate training with the medical societies, medical schools, and health departments. Industrial medicine is one of the newest specialties—therefore the shortage of physicians in this important field.

Health in Local Communities

The health in local communities is of great importance in national preparedness. This importance has a special emphasis in those communities where defense industries are located and also in those adjacent to military posts. For almost every worker there is attached a family, the health and welfare of which are the responsibility of the local, state, and federal health authorities. Workers must be treated as a part of the social structure, the basis of which is the family, and any health program that is aimed at him must include not only those with whom he works but also those with whom he lives and plays.

We all agree that we are interested in preserving the health of the worker if only for the sake of his usefulness in our national scheme of defense activities. However, we cannot isolate the worker from his immediate associates, we cannot overlook the necessity of making him aware of his responsibility in the effort to prevent and check the spread of infectious diseases in his immediate environs.

In this connection we must also consider the problem of housing of workers and their families. There are always great health and social problems brought about by large population shifts. The lack of adequate housing complicates and intensifies these problems. The great expansion of industries and also mobilization of troops have brought to us many of these situations.

There exists a shortage of skilled workers throughout the defense industries. Increased production has resulted in placing a greater burden on the physical capacities of the individual skilled worker. Since this situation exists, it becomes imperative that health hazards be reduced to a minimum. It is not possible to concentrate the problem of control of communicable disease on industrial groups to the exclusion of the surrounding communities. The workers are already grouped together by the very nature of their occupations and are, consequently, more easily reached than the bulk of our civil population. Health education carried to industrial communities will have far-reaching effects. This is particularly true in the case of venereal diseases. The burden of organized activity to maintain the health in industrial and military areas must be shared equally by local official agencies, municipal administration, and employers.

Special Health Problems

Large population shifts may introduce a diversity of special health problems. Many of these seem rather remote on casual examination, however, when considered in their fullness they take on a different perspective. One of these is malaria. There are many places where mosquitoes are prevalent which are capable of transmitting this disease. Workers migrating from sections where malaria is prevalent may well serve as a reservoir of infection. Also, troops returning from the Canal Zone and other tropical areas may also become sources of infection. There was a recent outbreak in a neighboring state resulting in 110 cases of malaria traceable to a boy who had been in a CCC camp in the South.

Therefore, it is easy to see the necessity for efforts to control mosquito breeding

Water and Sewage Facilities

The rapid and extensive increase in population of small towns and villages has, in many instances, overtaxed the water and sewage facilities. Frequently, the local government has not been able to effect an augmentation of these services to meet the needs. In some situations it may appear wasteful to spend large sums to provide services that may be in demand only temporarily. However, surveys reveal that in many communities water and sewage disposal facilities are already operating at more than efficient capacity. Thus, the present emergency provides an impetus for the expansion of facilities for which the need has been existent for some time. In any event, we cannot afford halfway measures when the health and welfare of workers vital to the national defense are at stake. That the Federal Government takes this position is evidenced by the fact that, where necessary, local funds will be augmented by Federal aid.

Milk and Other Food Supplies

The transmission of disease through milk and other foods is not new to us. The increased demands for milk should be accompanied by increased vigilance. Universal pasteurization must be practiced to provide safety in this regard.

It might be well to mention here that the Public Health Service, Federal Security Agency, and the Bureau of Dairy Industry, United States Department of Agriculture, have approved and recommended for adoption by states and communities a milk ordinance and code to encourage a greater uniformity of milk control practice in the United States.

This ordinance and code embodies the best information at present available on milk control legislation, but it should be subject to change as improvements are developed.

The source and handling of other food supplies must have adequate supervision. Fortunately, much has been accomplished in this field already, however, vigilance must be maintained.

Medical and Hospital Service

The rapid growth of small villages into boom towns has brought about need for adequate medical and hospital services. In some of these communities no hospitals exist. Hospital service cannot be provided on short notice.

It is also costly to provide and maintain. Coordination of hospital and medical facilities must be made, and transportation units of ambulances must be organized to meet the local needs.

There is also a shortage of nurses and laboratory technicians. Intensive courses would provide more technicians. Nurses' courses are necessarily longer. Here again, coordination of available talent with the needs is extremely necessary.

Venereal Diseases

At no time in our history has the necessity for the control of venereal diseases been so imperative. The needless loss of millions of days by troops during the last war because of venereal disease must not be repeated at this time. So much progress has been made in the field of venereal disease control that we now have weapons never available to us before. Principle among these is education. It must be extended and applied in every national endeavor.

The military authorities have facilities for education and extension of activities in this field, however, the sources of infection of troops are outside the military posts and, therefore, beyond the control of military authorities. This places the burden of venereal disease control squarely on our shoulders. It is a great responsibility and one in which all must participate. The health officer must assume the leadership and have the support of local physicians and the law enforcement agencies. We are not concerned with the prevention of infection only in troops but also in the skilled and unskilled workers who are so vitally important in our scheme of national defense. Therefore, venereal disease control must be a vital part of the general health program.

Every state now furnishes a free laboratory diagnostic service to all physicians. Expensive drugs for the treatment of patients are available to all doctors. In 2,887 clinics competent diagnostic and treatment service is available, in most of them, epidemiologic investigations are made to seek out the sources of infection and bring them under treatment. The private physician can render valuable service in the control of venereal disease by promptly reporting the infectious cases and, if necessary, asking for their quarantine. This will save many lost working days to our vital industries by preventing the spread of these diseases.

Prostitution must not be tolerated. It has

established during the past five years, almost entirely with Federal funds from Title VI of the Social Security Act. civilian population is equally as important as that of the armed forces

The underlying principles of public health and of medical service are no different today than yesterday. The challenge lies in our ability to apply our knowledge and technics so as to satisfy the problems of medical defense and produce the optimal effect. In accomplishing this purpose careful thought must be given to a readjustment of activities, particularly changes in emphasis, the adaptation of known principles to new problems, and above all the determination to act once the needs have become clear. Those of us well grounded in medicine and the specialty of public health need have no qualms as to our ability to meet this challenge.

In the previous World War, as in the present state of armed defense, health department personnel is responsible for protecting the health of the civilian population and also that of the armed forces, except when the latter are on military reservations. Today we are rediscovering some of the medical defense problems of the previous world conflict. An article written following the World War Armistice, discussing the war activities of the United States Public Health Service,² is most illuminating. Some of the activities listed in this report have already been reassumed in modified form by the federal service in dealing with present emergencies, others will likely be reassumed in the near future. However, public health administration and facilities have shown marked improvement since 1917, largely through employment of Social Security funds. State and local health organizations have been reorganized, their staffs increased with trained personnel, health programs perfected and broadened, the number of safe water supplies increased, and the use of pasteurized milk popularized. Of particular importance has been the inauguration of effective venereal disease control programs, a matter largely one of wishful thinking at the outbreak of the previous conflict. These advances will make it possible, at least in New York State, for state and local health departments acting together to provide a much more satisfactory health program throughout the state, inclusive of areas where concentrations of troops or of workers in defense industries occur, than was possible during the previous war. However, additional personnel or the curtailment of existing essential functions will be necessary if services beyond those now given are required for any extended period of time as a result of defense activities. Existing services

will likewise be hampered if health department staffs become reduced in satisfying the needs for personnel by the armed forces.

The problem of providing public health protection within the limit of available facilities for new arrivals in large numbers in a relatively small area over a short period of time is not a new problem in upstate New York. Annually, nearly 1,500,000 people spend from one week to two months in summer residence at camps, summer hotels, and boardinghouses in the counties of Sullivan, Rockland, Orange, and Ulster alone. Public health problems connected therewith are, however, of a somewhat different order than those arising from troop concentrations. An occasion of the latter type was experienced during August, 1940, when approximately 90,000 regular army and National Guard members gathered in the region of St. Lawrence County to participate in field training and maneuver activities. Prior to and during the maneuvers, special emphasis was placed on venereal disease control efforts and environmental sanitation in the area adjacent to the maneuvers and also at points of overnight bivouac of troops passing to and from the area. A feature of the sanitation work was the inspection of all types of food-handling establishments in an effort to discover health hazards and obtain correction of such defects.

The communicable disease incidence in the civilian population during the army maneuver period was within normal limits. No outbreaks were reported. Among the troops, two outbreaks of gastroenteritis were reported, involving approximately a total of 180 men. The cause of the first outbreak was probably a preformed staphylococcus toxin in a batch of sandwiches. These were prepared at a bivouac point, transported in the rear of a car all day, and eaten by the men on their arrival at camp. The second outbreak was of bacillary dysentery and was limited largely to a single infantry regiment. It was believed to be water-borne from use of an unauthorized well in the vicinity of their camp.

The venereal disease incidence among the troops was low. During August a total of 53 cases of gonorrhea and 3 cases of syphilis were reported, a total rate of 6.2 cases per 10,000. Of these, only 12 cases of gonorrhea and no cases of syphilis were indicated to have had their origin within the maneuver area. Thirty-nine of those found to be infected stated that exposure took place prior to leaving home or en route, the remaining 5 gave indefinite information. Unfortunately, no information

been demonstrated that it is virtually impossible to control this problem by police and medical surveillance. The local law enforcement authorities can and must eliminate it with the cooperation of the health authorities in finding and suppressing sources of danger.

Prophylaxis in Venereal Diseases

The prevention of infection is an important factor in the control of any disease and especially in venereal diseases when we consider the seriousness of them. An educational program will do much in this particular field, it should be well organized and carried out effectively. Every health educational program should include information on venereal diseases: what they are, how contracted, how prevented, and how cured.

In the matter of chemical and mechanical prevention of syphilis and gonorrhea, the American Social Hygiene Association and the United States Public Health Service appointed a special joint committee to study and report on this phase of prevention. This committee made recommendations that were published in several medical journals and are now avail-

able. The procedure recommended is essentially the one that is employed by the military forces and has, no doubt, been responsible for the low rate of infection in troops. The committee recommended chemical and mechanical prophylaxis as necessary to decrease the number of carriers of infection and, hence, is complementary to educational measures.

Conclusion

The present crisis with which we are faced and the resultant need for industrial and military mobilization have not necessarily injected any entirely new problems into the scheme for healthy living but, rather, have intensified the need for the control of old problems which the present situation has amplified. Therefore, it is the job of state and local health departments, with the cooperation and, if necessary, financial assistance of the Federal Government, to augment existing facilities or organize new ones for the maintenance of necessary standards of health and sanitation, particularly in those areas adjacent to the locations of our industrial and military forces.

FROM THE VIEWPOINT OF THE STATE HEALTH DEPARTMENT

V A VAN VOLKENBURGH, M D, Dr P H, Albany, New York

IN ACCEPTING the challenge to defend the ideology of democracy, more than defensive efforts will be required. Each week brings closer the realization that if we are to defend democracy successfully we must assume the offensive and fight to preserve it with every means at our disposal whatever the sacrifice. Self-interest, jealousy, greed, and hate must be subjugated to the common welfare. These forces not only breed wars of conquest but are the chief allies of those wishing to cause dissolution in the countries they desire to control. Unity of thought, of purpose, and of action, with the single goal of preservation of the democratic way of life, will be necessary to cope successfully with the problems ahead of us.

Much has been written and a great deal said regarding health and medical preparedness in national defense activities. Outstanding is an address by Surgeon General Thomas Parran¹ in which the needs are clearly foreseen and

defined. It is worthy of thoughtful and repeated perusal by every worker active in the practice of medicine and public health. From sources such as this, it is encouraging to note that all agree as to the need for "total defense" in combating "total war" and that all recognize the necessity of securing for every member of our population the highest possible level of physical and mental health.

Mechanized warfare demands an ever increasing production of war material. Battles may be won or lost in our factories rather than in the field. It is disconcerting to learn that time lost during the last year due to industrial accidents and disability has been estimated as enough to build fifty-two superdreadnaughts of the class of the North Carolina, according to J J Bloomfield of the United States Public Health Service. Civilian defense forces operating on the home front have been found as necessary a part of defense as front-line troops. It is well recognized that disease is indifferent to boundary lines marking off military zones. From facts such as these has come the realization that the health and physical fitness of the

Assistant Commissioner, Local Health Administration,
New York State Department of Health.

civilian population is equally as important as that of the armed forces

The underlying principles of public health and of medical service are no different today than yesterday. The challenge lies in our ability to apply our knowledge and technique so as to satisfy the problems of medical defense and produce the optimal effect. In accomplishing this purpose careful thought must be given to a readjustment of activities, particularly changes in emphasis, the adaptation of known principles to new problems, and above all the determination to act once the needs have become clear. Those of us well grounded in medicine and the specialty of public health need have no qualms as to our ability to meet this challenge.

In the previous World War, as in the present state of armed defense, health department personnel is responsible for protecting the health of the civilian population and also that of the armed forces, except when the latter are on military reservations. Today we are rediscovering some of the medical defense problems of the previous world conflict. An article written following the World War Armistice, discussing the war activities of the United States Public Health Service,² is most illuminating. Some of the activities listed in this report have already been reassumed in modified form by the federal service in dealing with present emergencies, others will likely be reassumed in the near future. However, public health administration and facilities have shown marked improvement since 1917, largely through employment of Social Security funds. State and local health organizations have been reorganized, their staffs increased with trained personnel, health programs perfected and broadened, the number of safe water supplies increased, and the use of pasteurized milk popularized. Of particular importance has been the inauguration of effective venereal disease control programs, a matter largely one of wishful thinking at the outbreak of the previous conflict. These advances will make it possible, at least in New York State, for state and local health departments acting together to provide a much more satisfactory health program throughout the state, inclusive of areas where concentrations of troops or of workers in defense industries occur, than was possible during the previous war. However, additional personnel or the curtailment of existing essential functions will be necessary if services beyond those now given are required for any extended period of time as a result of defense activities. Existing services

will likewise be hampered if health department staffs become reduced in satisfying the needs for personnel by the armed forces.

The problem of providing public health protection within the limit of available facilities for new arrivals in large numbers in a relatively small area over a short period of time is not a new problem in upstate New York. Annually, nearly 1,500,000 people spend from one week to two months in summer residence at camps, summer hotels, and boardinghouses in the counties of Sullivan, Rockland, Orange, and Ulster alone. Public health problems connected therewith are, however, of a somewhat different order than those arising from troop concentrations. An occasion of the latter type was experienced during August, 1940, when approximately 90,000 regular army and National Guard members gathered in the region of St. Lawrence County to participate in field training and maneuver activities. Prior to and during the maneuvers, special emphasis was placed on venereal disease control efforts and environmental sanitation in the area adjacent to the maneuvers and also at points of overnight bivouac of troops passing to and from the area. A feature of the sanitation work was the inspection of all types of food-handling establishments in an effort to discover health hazards and obtain correction of such defects.

The communicable disease incidence in the civilian population during the army maneuver period was within normal limits. No outbreaks were reported. Among the troops, two outbreaks of gastroenteritis were reported, involving approximately a total of 180 men. The cause of the first outbreak was probably a preformed staphylococcus toxin in a batch of sandwiches. These were prepared at a bivouac point, transported in the rear of a car all day, and eaten by the men on their arrival at camp. The second outbreak was of bacillary dysentery and was limited largely to a single infantry regiment. It was believed to be water-borne from use of an unauthorized well in the vicinity of their camp.

The venereal disease incidence among the troops was low. During August a total of 53 cases of gonorrhea and 3 cases of syphilis were reported, a total rate of 6.2 cases per 10,000. Of these, only 12 cases of gonorrhea and no cases of syphilis were indicated to have had their origin within the maneuver area. Thirtynine of those found to be infected stated that exposure took place prior to leaving home or en route, the remaining 5 gave indefinite information. Unfortunately, no information

was obtainable as to the number of cases occurring after the return of the men to their homes in this and other states. Nonetheless, it is believed that an epidemic of gonorrhea would have shown itself during the maneuver period had such occurred, since the incubation period of the disease is so short. With syphilis, however, evidence of widespread infection would not have come to light until after the maneuvers were over.

The above is cited as a relatively simple example of the excellent results obtainable by well-organized health services in an emergency situation. There was no mention, however, of the careful thought given to formulation of plans to meet the situation or of the effort spent in coordinating the services of the army and the various state and local official and nonofficial groups assisting in bringing about these results. This phase of the work is emphasized since, in planning for medical defense, success or failure will largely depend on our ability to coordinate satisfactorily the work of the many groups and individuals engaged in health and allied activities.

In New York State steps have already been taken to provide permanent official coordinating agencies. As you know, Governor Lehman appointed Lieutenant-Governor Poletti as State Coordinator for National Defense in organizing the New York State Defense Council. This agency is closely associated with the National Defense Council at Washington and its various functional coordinators. The federal coordinator for health, welfare, and recreation is Paul V. McNutt.

Almost a year ago Mr. Poletti requested that an existing state commission known as the New York State Temporary Legislative Commission to Formulate a Long Range Health Program assist the State Defense Council by assembling and analyzing data relative to the health resources of the state.² The Commission thereupon appointed a subcommittee for health preparedness as an advisory agency. Members of the subcommittee include representatives of state organizations of physicians, hospitals, dentists, optometrists, pharmacists, nurses, such nonofficial agencies as the Red Cross and State Charities Aid, and representatives from the State Departments of Health, Welfare, and Education. The Commission, in bringing these representatives together, not only provided itself with sources of authoritative information and advice but placed itself in the position of being able to assist in coordinating the health preparedness activities of the various health agencies organized on a

state basis. Its function, thus far, has been chiefly that of surveying health resources. Under present arrangements, state departments responsible for health programs, the Commission, and possibly nonofficial medical and health agencies report each month to Mr. Poletti on their activities and present to him their recommendations.

One of the suggestions of the Commission was the desirability of forming official health advisory committees organized on a county basis, the suggested membership to include the chairman of the board of supervisors or the county executive, the chairman of the medical preparedness committee of the county medical society, the county welfare commissioner and county representatives of the local hospitals, the district and local health departments, the dental society, the nurse association, the pharmaceutical society, and the American Red Cross. The suggestion was approved by Mr. Poletti and, according to a recent report, the City of New York and fifty-four counties out of a total of fifty-seven in the entire state now have advisory health preparedness committees which, it is hoped, will function effectively. In most instances, each county committee is directly represented on the County Defense Council by the chairman of the medical preparedness committee of the county medical society. Each county committee is also closely linked to the State Health Commission which, as has been shown, is one of the health advisors of the State Coordinator for National Defense. The functions and duties of the county health advisory committees have been defined³ to include the coordination of health preparedness activities of the various health groups within the county, the assembly of health resource data, the making of recommendations to the County Defense Council (including advice as to individuals of selective service age whose services are considered essential to insure civilian health protection), the filing of reports of meetings with the State Health Commission, the reporting of local health needs to the Commission, and, finally, the general promotion of health preparedness within the county.

From the foregoing it would appear that from the standpoint of organization the state is in a position to coordinate satisfactorily the work of its many health agencies not only with each other but also with the broader and more complex activities of county, state, and federal national defense. It should also be noted that in servicing coordinating efforts it is necessary that the various health agencies maintain

a high order of efficiency and character of work and, in addition, make provision for the rapid shifting of personnel and equipment for the handling of emergencies. In respect to the latter, the State Health Department fortunately is so organized as to lend itself readily to handle emergencies. With its twenty branch offices, each strategically located in the state and each staffed with medical public health officers, sanitary engineers, nurses, milk sanitarians, inspectors, and clerical force, it is possible for the personnel not only to keep in close touch with local situations in their district in carrying out their regular assignment of supervising and assisting local official health agencies but also to serve as a reservoir of trained personnel, making possible overnight assemblage in one or more threatened districts. Similarly, assistance is available from the central office of the department in supplying experts in the various specialties of public health.

In dealing with problems of medical defense, too much dependence on old-fashioned ways of doing things should be avoided if success is to be attained in preventing and controlling the spread of disease. As suggested by Homer Folks,⁴ today's problems require of everyone resourcefulness, adaptability, and quickness in discerning and measuring impending changes, new needs, and new situations. While the disease conditions to be encountered will likely be much the same as in the previous war, changes in the environment, in the habits of living, and in the character and conduct of war have been extensive and must be carefully considered in planning for the use of control measures.

Inexpensive, readily available, and rapid means of transportation will be a factor to keep in mind. It has already complicated venereal disease control efforts. The prostitute, owning an automobile or, in many instances, a trailer, is able to change the scene of her operations almost nightly making it difficult to be located in follow-up investigations. More commonly, the average soldier on a free evening is prone to join his mates, hire a car, and within the hour be at a rendezvous some 30 to 40 miles away. These practices nullify to a great extent the value of establishing closely policed extra cantonment zones in the immediate vicinity of camps, a practice of some value in controlling the spread of venereal disease during the previous war. Present efforts would appear to be more profitably spent in studying the habits of the soldiers, observing where they congregate, and

instituting adequate control measures at such centers.

Prophylaxis stations, extensively used by soldiers during the previous conflict, had few patrons during last summer's upstate army maneuvers. This may have been due to an increased use of condoms and sanitubes. These devices were purchasable at a low price at most of the canteens and post exchanges within the area. It is important to note, however, that there is no longer an army regulation requiring a soldier to report for prophylactic treatment following exposure. Penalties are imposed only if the soldier fails to report for treatment for venereal or suspected venereal disease.

The widespread use of the automobile has its compensations. It is likely that the incidence of the so-called "childhood" diseases will be materially lower among the rural selectees in army camps when compared with the situation twenty-four years ago, since the almost universal use of the automobile has greatly diminished the isolation of rural dwellers resulting in fewer nonimmune soldiers. The automobile has also been a factor in relieving housing shortages caused by defense industry activity and has thus prevented what might well have been serious overcrowding with resultant communicable disease hazards in some communities. It should be stated, however, that automobile accidents have increased materially from the practice of living within a radius of 15 to 60 miles distant from the place of employment. In some instances it has also caused a severe strain on the sanitary facilities of small villages.

The acquisition of military bases in South American waters and the exchange of military and economic missions in furthering the hemisphere defense program presages increased interchange of populations. As a result, danger from tropical diseases may be materially increased in the days to come. It should be remembered that yellow fever continues to be a constant threat to the southern half of the United States. Epidemics of the disease have occurred in the past in the cities along the North Atlantic seaboard. With the skyways soon to be crowded with airplanes, present mosquito control measures used on planes from South America may break down under the stress of defense emergencies.

The control of malaria within the borders of North America is of even greater importance. In New York State new cases of malaria are reported each year. However, the number of such cases have been few in recent years.

Extensive mosquito control projects have been in effect on Long Island for some time

The possibility of sabotage and bombing reflecting the "all-out" technics of present-day warfare demand action on the part of municipalities long in advance of such possible occurrences if the population is to be kept free from communicable diseases transmitted by milk and water. Damage to electric power lines may stop the operation of many pasteurizing plants leaving only raw milk available. Power failure is similarly disastrous to water treatment and purification plants but is only one of many factors that might disturb continuity of service and the maintenance of a safe water supply. It is possible to circumvent many of these factors. Water and sewage treatment plant officials in the state have been advised of the more important precautions to be taken. Desirable procedures are authoritatively discussed by Harry E Jordan⁶ in a recent publication.

Advance preparation for medical care is similarly necessary in coping with disaster. Some cities have already established catastrophe units operating from city hospital bases, have designated certain buildings as local collecting centers for the injured, determined the part each hospital will assume in carrying out the project for the city at large, and have made plans for reception area hospitals to receive evacuees able to be moved from centrally located hospitals. In times of emergency, however, the success of such plans will depend on how closely they are coordinated with the broader plan of city emergency defense, which includes the management of transportation and communication, law enforcement, fire extinguishing, and maintenance of utility services.

Cities likely to be bombed should plan for the evacuation of a large portion of their population. A survey of the available facilities in areas adjacent to these cities should be made, including housing, hospital, and laboratory facilities. In the counties bordering on New York City, a study should be conducted as to the improvements necessary to make summer quarters habitable the entire year. Commencing a year ago, the State Department of Health intensified its efforts in these counties to insure adequate sanitary facilities for camps, summer hotels, and boardinghouses. In the Catskill region alone there are nearly 5,000 hotels and boardinghouses and 360 camps not served by public water supply and sewerage systems.

Compared with twenty-four years ago,

there is much to be thankful for in contemplating today's medical defense problems. Significant strides have been made in chemotherapy, in serum therapy, in the collection and preservation of blood, and in the development of immunizing agents. Such diverse conditions as pneumonia, gonorrhea, meningitis, shock, yellow fever, and tetanus would appear to have lost much of their previous threat. According to a recent report,⁶ sulfadiazine, one of the new experimental drugs, gives promise of swiftly banishing the meningococcus from the nose and throat of not only meningitis cases but also healthy carriers of the organism. There is some hope that the combined vaccine developed by Dr. Frank Horsfall, Jr., of the Rockefeller Institute for Medical Research may be useful in preventing influenza virus A infections. Recent advances in the newer knowledge of nutrition have been extensive and are about to be popularized over the state through publicity by the newly organized county nutrition committees.

Of great significance is the cooperative attitude shown by the physicians and authorities of this state in putting into effect the requirement that each selectee be given a serologic test for syphilis and that each selectee appearing before the army induction board be x-rayed for chest pathology. Data are now available from the examination of 87,206 serologic specimens obtained from upstate men at the time of physical examination. Sixteen out of every 1,000 specimens were found to show some degree of positivity by the state and local approved laboratories participating in the testing. Excluding the cities of New York, Albany, Buffalo, Rochester, and Syracuse, 985 positive serologic tests were reported. Of these, physicians reported 571 as cases of syphilis. The status of the remainder is pending. Fifty per cent of the 571 cases were reported to the department prior to the selective service test. Only 11 per cent of the total cases were classified as early syphilis. Of the 21,708 men x-rayed at the three upstate induction centers, a duty now taken over by the army authorities, 157 were found to have tuberculosis, a case yield of 0.7 per cent. Of the total cases, 32.5 per cent were classified as moderately or far advanced cases. Needless to say, efforts by health departments include the investigation of each newly discovered case of infectious syphilis and tuberculosis in an effort to determine source and contact cases, as well as making sure the patient obtains and continues under adequate treatment.

The problem of rehabilitating selectees ex-

amined and deferred because of minor physical defects, easily remediable, is at the moment a moot one. Col Samuel J Kopetzky, chief of the medical division of the New York City Selective Service, reporting on the results from the first six months of New York City Selective Service examinations, states that 24.85 per cent of those examined were placed in the deferred class, although it would be possible with little effort or expense to make them physically fit for full military duty. Dr Kopetzky believes that the army should do the job. A plan offered by the Selective Service Headquarters in Washington proposes "prehabilitation," leaving it to the initiative of the registrant to find out if he meets the army requirements before coming up for physical examination and to see that discovered defects are immediately corrected. Without doubt, some satisfactory plan will soon be placed in effect to insure that every deferred selectee with remediable defects will obtain the necessary corrections regardless of economic status. It would appear that a time-worn public

health objective suggesting an annual physical examination with correction of defects is about to bear fruit, at least within a certain segment of the population.

In closing, previous remarks are reiterated for emphasis. The problems of today require of everyone resourcefulness, adaptability, and quickness in discerning and measuring impending changes, new needs, and new situations. Much depends upon our ability to apply our knowledge and techniques to these new needs and to act once the needs become clear. The objective is to secure for every member of our population the highest level of physical and mental health.

THE PART OF THE CIVILIAN PHYSICIAN IN THE DEFENSE PROGRAM

JOHN D. NAPLES, M. D., Buffalo, New York

AT PRESENT, there are approximately 190 physicians in Erie County examining selective service registrants. Most of these men are examined in the civilian physicians' own offices. Furthermore, they are examined on the doctors' own time. One fact is worth mentioning at this time and that is that the doctors are not paid a single penny for this work. They have willingly accepted the task as part of their moral responsibility in the defense program. Sometimes these doctors are even subjected to severe criticism by some of the laity.

There are two hospitals in the City of Buffalo where these examinations are made by a group of six doctors in teamwork fashion. Here, it is decidedly easier, because each physician performs just one part of the examination instead of the entire one. For example, one doctor examines the eyes, another the nose and throat, another the chest, etc.

The examinations rendered are, of necessity, strict. It has been shown that during the

World War 1,200,000 men had to be examined in order to get the necessary first 800,000 for induction. It is estimated that these same figures will hold good at the present time. Statistics in the New York area show that approximately 49.5 per cent have been rejected. The figures in this area have been about the same. The records in one of the hospitals here where the examining of these applicants is done show a rejection, at times, of as high as 54 per cent. Furthermore, after these men have been examined by the civilian physicians, they are sent for final check-up by the physicians at the induction centers. In this Buffalo area our experience has been that further rejections have been made. Statistics show that the percentage of further rejections at the induction centers have ranged from 11.6 to 17 per cent. This, of course, would bring the percentage of rejections a bit higher. In the World War, 40 per cent of those examined throughout the entire New York State were rejected. This year even though this rate is higher, around 49.5 per cent, I believe that it compares favorably and shows that the health of the community is as good as it

was during the World War. The reason for the higher percentage of rejections at present, of course, is due to the fact that the examinations are stricter. For example, today, Wassermann tests and x-rays of the chest are taken on every selectee. This was not done at the time of the last war. Of course, it is obvious that the physician is rendering a real service by applying these special tests. Many cases of tuberculosis and syphilis which otherwise would not come to the doctor's attention have been discovered. Those who are found to be afflicted are, in every instance, referred to their family doctor. In this way the physician in civil life can now render adequate treatment in these newly discovered cases.

A serious question therefore arises as a result of these rejections. What are we to do with these men? It seems to me that there is a twofold duty.

(1) To correct these defects and thereby better prepare these men for future induction, if necessary.

(2) To correct these defects so as to render the men better able to work in defense industry.

As mentioned above, the men who have been turned down are, in every instance, referred to their family doctor. Herein lies an important obligation of physician to his patients. A good many of these defects are due to eyes and teeth—as high as 14 per cent or more in each instance. These conditions may be quite readily remedied. Hernias, defects of the skin, nose and throat, and extremities, and venereal diseases could be most readily corrected.

If these defects are corrected, then there is no reason why the selectee should not be ready for military duty in the near future. If they are not corrected, then the men having these defects can enter into some profitable industry associated with the national defense program.

The physician who remains at home must, of course, keep up the physical condition and health of the civilian population and the morale of the people. This morale depends much on the physical fitness and health of the people. These are all-important factors in defense.

Let us consider Erie County. At present

in the county society, there are 808 doctors in general practice. According to the population there would be about 1,000 persons to each physician in general practice. There are 205 specialists. Here the ratio would be about 4,000 people to each specialist. If the ranks of the physicians are seriously depleted because of induction in the Army, how are we going to arrange to care for this extra work?

In the first place, how much more work can the individual physician do? Most of us are doing all we can handle at present. Therefore, we cannot say, for instance, that each doctor would have to take care of an additional third or half of what he is now doing. I do not see how anyone can really gage the extra amount of work that the doctor will be able to care for. Let us not lose sight of the fact that the health of the physician must also be protected. I believe that this, too, is an important factor in National Defense.

It seems to me, however, that one plan is certainly worthy of consideration, and that plan is to allow the students in medical schools to finish their education and not be inducted into the service. Beyond this, I believe that the graduate from medical school should be allowed to complete his year of internship. This will help in many ways. First of all, it will help us in our hospital work. We certainly cannot run a hospital without interns or without a sufficient number of them. Now, if the medical-school graduates are allowed to finish their internship, then these men would be able to do one of two things—either serve in the Army if they are needed or fill the places of those called into service. Personally, I think it would be advantageous to take the recent graduate into the training camp. He would be better suited to some of the routine procedures than the older physician.

Some may advance the argument that allowing the student to finish his course would make the medical schools a haven for draft dodgers. This argument, I think, is fallacious. The requirements for entrance into medical schools are so strict and the classes so limited that these institutions would carry on just as they have in the past. This would most certainly keep those not qualified out of the medical schools.

654 Seventh Street

SCHOOL PHYSICIANS TO MEET

The New York State Association of School Physicians will hold its Annual Meeting and Conference on June 23 at the Grand Union Hotel, Saratoga Springs, New York. A worth-

while program of interest to school physicians, nurses, dental hygienists, health officers, and general practitioners will be presented at the afternoon and evening sessions.

SUBNORMAL VISION AND OCCUPATIONAL APTITUDE

ALBERT C. SNELL, M D , Rochester, New York

THE aptitude of individuals for particular jobs and their placement in such jobs, based on certain physical and mental standards, is receiving increasing attention from employers and management, from organized labor, from governmental labor departments, and from physicians. Each of these groups has a different point of view as to the minimum requirements for these standards which is influenced by their respective interests. These interests present problems in economics, sociology, and government. Employers and management are primarily interested in costs and production, labor in jobs and wages, and government in fair dealing between these two groups as well as in the welfare of the consumer. The physician's primary interest in these problems relates to the influence that physical defects may have on them and on the prevention or correcting of these physical defects, as far as possible, for the common benefit of all. Physicians would like to bring about universal physical perfection, but perfection does not exist and the desire for it is impossible of fulfillment. Therefore, placement in industry or in other vocations should take into consideration existing human abilities in order that all employables may find their proper place of usefulness. Such a method would imply a knowledge of individual aptitude for any specific job or service.

General aptitude depends on a high degree of general physical fitness, on intelligence, on personality, and on training or skill, all of which are interdependent. However, this paper deals only with the relationship of vision to occupational aptitude, and its scope is limited to a consideration of the place in industry for potential employees or those seeking advancement who have subnormal vision in one or in both eyes. That good vision is essential for almost every kind of occupation cannot be questioned. Although much has been written about the efficiency of normal vision for many types of employment, the question that considers, "How good must an individual's vision be to assure a reasonable degree of efficiency in a specific job?" has not received the attention it deserves. And on this question hinges the cleavage between the various groups mentioned above. A proper

answer to it will help to remove this cleavage between employer and employee and will place many potential employees into positions that they will be able to fill aptly.

Dr. Culler, in a paper entitled "Visual Efficiency in Industry" read recently before the Third Annual Industrial Congress, said "Industrial efficiency depends almost entirely on visual efficiency." This is a true generalization but, as recognized by Dr. Culler, it needs some modification and explanation to make the truth applicable and practicable. Although some degree of vision is essential to efficient accomplishment, not all types of work require the use of two eyes or the same degree of visual perfection in order that a job may be accomplished efficiently whether one is using one or both eyes. In some jobs only one eye is used for critical seeing, and such jobs may be accomplished even more efficiently by the monocular person. The following are examples: the watchmaker, since he uses his loupe before one eye, is just as efficient having only one good eye as is the two-eyed man, jobs requiring alignment of objects are done better with the use of one eye, also one-eyed laboratory workers who use the microscope or other monocular instruments of magnification are equally as efficient as are the two-eyed workers. There are many other occupations where this holds true. In these occupations and in similar ones the image of one eye, when both eyes have good vision, must be ignored or suppressed. This is most difficult for some to do. The one-eyed worker has no difficulty in this respect.

Another advantage for monocular persons is found in the fact that they rarely have headaches, without regard to nature of employment. This I pointed out in a paper written in 1921 in a study of 1,000 cases of functional monocularity. I have since verified this observation from many additional cases. Also, monocular individuals are less troubled with other symptoms associated with ocular fatigue or with heterophoria. Nor can they be troubled with symptoms associated with aniseikonia. Thus, freedom from many ocular symptoms contributes to their general efficiency.

Persons with perfect binocular vision, determined by the highest degree of perfection or by the established standard for normal eyes

—persons having perfect visual functions under all conceivable conditions of modern industry for prolonged periods of application—are in the minority To what extent subnormal vision is present among industrial employees, including the clerical force, may be seen from some recent statistics compiled by Dr Hedwig Kuhn and her co-workers in a paper recently read before the last meeting of the Academy of Ophthalmology and Otolaryngology She found 36 per cent of employees with defective vision (Her tests included more than just visual acuity) Serious visual defects were found in 15 per cent of all employees Dr Kuhn properly considered a 20/40 acuity as the dividing line between the "normal and the defective" and 20/30 as normal based on general visual aptitude Thus, 15 per cent of all employees had an acuity of 20/40 or less She found that 20 per cent of applicants for jobs fell below this standard The proportionate number of young adults having defective vision is illustrated by a recent report, made by Dr Kopetzky, of the number of draftees rejected because of defective vision He reports that 11.7 per cent of those examined for the draft were rejected for unlimited military service (Class 1-A) because of defective vision And the standard for this class is not high, being for acuity a 20/100 without glasses correctable to 20/40 bilaterally From these statistics it is shown that approximately 20 per cent of the adult population have subnormal vision of more than a trivial degree, and this is not the complete picture

In addition to the above, consider also that 2 per cent of the male population are color blind, that 20 per cent of the college graduates are myopic, and that the entire population who have reached the age of 50 will be found to have defective vision if visual tests must be made both for near and for distance *without the use of correcting lenses* Color vision is required for some occupations Many myopes have an acuity of less than 20/100 without glasses, and many potential employees are rejected on this ground To require that visual standards shall be determined from tests without lenses seems fanciful and ridiculous It is, but many compensation laws require that acuity be tested without glasses to determine visual disability and awards are made on this ridiculous basis If normal vision without the use of glasses should be required in all industry, 40 per cent of all employees under 48 years of age would be rejected, and after 50 years of age 100 per

cent would be rejected if vision both for near and for distance must be determined without correcting lenses The importance of determining reasonable standards of visual aptitude for specific jobs is obvious from a consideration of these facts if society is to make use of existing human abilities and if the number of the permanent unemployables is not to be increased

Employers and management, many of whom require a physical examination including a visual one of employees prior to employment, are much inclined to demand practically perfect vision of new employees This has caused a large percentage of potentially competent employees to be rejected In organized labor there is increasing resentment toward all physical examinations because of rejections that seem to them to be unjustified Departments of labor have much sympathy with this point of view In order to prevent conflicts and social cleavages between employer and employee there must be an understanding of each other's problems and a spirit of cooperation in their solution

Let us consider briefly some of the reasons for these conflicts and cleavages Is the demand for perfection for all kinds of industrial employment unreasonable? What would result from such a standard? Perfection in every individual is not demanded, nor can it be obtained, for other vocations For example, all persons are not endowed with equal physical strength, nor are they endowed with equal brain capacity To set up a standard equal to the best for any human physical or mental function would place nearly all of us in an inferior class and, if only the perfect can find employment, 90 per cent of employables would be on relief Defective vision would be the predominating cause for this situation Therefore, to set up a standard of physical perfection of function in any organ as a basis of employment is obviously unreasonable

Some of the reasons for the development on the part of the employers of the practice of requiring high visual standards for employees are not difficult to discover Management is primarily interested in efficiency, in costs, and in accident prevention, they have been led to believe that minor degrees of subnormal acuity express a comparatively high degree of visual inefficiency and, therefore, that these minor visual defects are responsible for considerable loss in productive efficiency and for accidents They have been assessed in some states at unreasonable rates for trivial

eye injuries This method of assessment is due to the fact that these state compensation laws do not base awards for visual damage on a percentage loss of working efficiency or of earning ability—not even on the percentage loss of function but often on loss of relative visual acuity alone Thus, minor degrees of subnormal acuity, which are far more frequent than the major, are given a relatively high degree of percentage disability For example, since relative acuity notations are erroneously regarded as fractions of vision in New York State, this state makes an award of 20 per cent when acuity is 20/25, a normal for many individuals, and a 50 per cent award when acuity is reduced to 20/40 Thus, New York's Labor Board holds one to be half blind with a best acuity of 20/40 But note the logical inference of this interpretation If this interpretation is correct, then the army is accepting all draftees who are half blind and New York State is permitting a person who is half blind to drive an automobile Such inconsistent, unsound, and erroneous interpretation of subnormal acuity causes confusion and makes employers wary of employing those with any degree of subnormal vision Furthermore, in many states pre-existing visual defects are not taken into consideration when the partial loss of vision is determined, and such determinations must be made without correcting lenses Therefore, since employers have learned that they are compelled to pay damages for losses to vision which are not the result of accident in their employ and since they have become conscious of the unfair assessment of damages for minor visual defects, they naturally wish to employ the young and only those having nearly perfect vision. These unfair methods of evaluation of visual disability are responsible for many rejections of applicants for employment If some of these unfair practices could be eliminated, there would be fewer rejections of potential employees with minor degrees of subnormal vision which, in fact, are not incapacitating

Labor and government are concerned with the discrimination against employees with minor physical defects since this implies that many of these who would be efficient at most jobs and who could be profitably employed are regarded as unemployable That many with minor visual defects who are otherwise physically fit are denied employment is well known to every ophthalmologist from his daily experience Many hundreds of case records could be cited to illustrate this point,

but I cite only the 3 following cases as examples

Case Reports

Case 1—Mr T J, aged 20, has been recently rejected on account of vision by several industrial plants at a time when skilled mechanics are in demand for defense production. He has had four years, four thousand hours, training in machine shop work He has never had an accident and is regarded as extremely efficient He is much interested in machine work and is an intelligent youth, physically fit He has an acuity of 20/20 without glasses in the right eye and 20/200 in the left Right is hyperopic +0.75 S The left is amblyopic and has mixed astigmatism, improved to 20/100 He never has a headache He was told by the employment manager of the Curtis Company of Buffalo that they required an acuity of at least 20/50 in the poorer eye and also that the vision in the good eye might become blind because of the poor sight in the left

Remarks—This young man is becoming discouraged and cannot understand why he should be rejected The statement above as to the possibility of blindness is, of course, entirely fallacious

Case 2—Mr F B, aged 43, was rejected by E K Co because of defective vision He has been employed in construction work His visual acuity without correcting lenses was O D 20/65, O S 20/50, refraction O D -1.25 S C +1.75 C ax. 75°, acuity 20/30, O S -1.75 C ax. 180° acuity 20/20 Fundi were negative The patient states that he has done all kinds of building construction work

Case 3—Mr E E, aged 30, applied for a position as fireman for R.R. and was rejected because of his eyes He has a visual acuity of 20/15 in each eye Refraction was found to be +2.00 S O² The reason for rejection was stated to be "eyes were too strong"

Amblyopia in one eye with a 20/40 acuity or less, which is found in approximately 1 or 2 per cent of the adult population, is a common cause for rejection. Myopia of more than a -4.00 found in 5 per cent, is the next most common cause for rejection, even though there is a normal acuity with lenses Many myopic adults are more efficient at close work than are the normal or hyperopic workers Repeated rejections of these applicants, making them feel that they are unemployable, cause discouragement and inferiority complexes that often lead to a pathologic state of depression or, at times, to an anti-social attitude toward society or its established forms of government These potential employees should be given an opportunity to demonstrate their aptitude in suitable jobs.

In some special types of disability it would

seem advantageous to permit a waiver to be used. Many potential employees with at least one good eye could find employment more readily if more state statutes would permit such employees to waive their rights to compensation for specific hazards. This is done in Massachusetts. The specific hazards assumed by these employees should be definitely stated in the waiver, and the right of waiver should rest with the administrators of the compensation statute to protect the rights of the employee. The Massachusetts statute reads:

"Section 46. No agreement by any employee to waive his rights to compensation shall be valid, but an employee who is for any reason peculiarly susceptible to injury or who is peculiarly likely to become permanently or totally incapacitated by an injury may, at the discretion of the department and with its written approval within one month of the beginning of his employment, waive his rights to compensation under sections thirty-four, thirty-five and thirty-six, or any of them."

By the use of the waiver, employers would not be required to assume any unusual risk connected with a known visual disability, for this would be assumed by the employee when he chose to assume some definite risk. When these employees are properly placed they rarely sustain accident. Support of this statement is found in a study of "second injury" cases made by Mr. Herbert A. Dallas, supervisor of rehabilitation, State of Massachusetts. ("Second injury" workers are those who have had some serious permanent disability, including loss of visual acuity to 20/70 in one eye.) Mr. Dallas states, in a letter written to me, that since the enactment of the law in 1919 to 1937 "only 19 cases of second injury eligible for payment from a special fund were reported to the Department of Industrial Accidents. In view of the fact that from 35,000 to 50,000 loss-of-time cases are reported annually, you will see that second injury cases are few and far between."

The growing tendency to demand a high degree of physical fitness, including vision, is found especially in those larger industrial plants with which there is connected a medical staff, on some of which there is a consulting ophthalmologist. In most of these plants there is a most commendable practice of continuing to employ those who have acquired defective vision either from accident or from other causes. The discrimination against

those with subnormal vision applies largely to new applicants for jobs. This growing tendency of discrimination can be reversed when *visual aptitude for specific jobs* is better understood by management and by industrial medical staffs. Such an understanding will be advanced when there are established authoritative visual aptitude standards. At the present time complete and satisfactory visual aptitude standards have not been established, and the establishment of minimum standards consistent with the required quality of vision for specific jobs is a necessary step for determining the proper placement of employees.

Not all jobs require perfect vision for a high degree of general visual aptitude. Accomplishment or industrial production depends on several factors in addition to good vision. As in general physical aptitude, visual aptitude also depends on intelligence, training, skill (natural and trained), personality, etc. Thus, aptitude for any specific job does not depend on normal vision alone but on a summation of functions and qualities. Therefore, in determining the placement of an employee—in determining his visual aptitude for any particular job—subnormal acuity or some degree of subnormal visual function should not alone be regarded as sufficient grounds for rejection. His placement should depend on his general physical and mental aptitude for a specific job, as well as on visual aptitude. Many employees with minor degrees of subnormal vision but who rate high in other physical or mental qualities may be even more efficient in certain jobs than are those with normal vision but who rate low in other aptitude tests. Thus, in order to determine "visual aptitude" there must be a consideration and correlation of the many factors that relate to the nature of the specific job, to individual characteristics, and to the minimum visual requirements that are necessary for efficient accomplishment.

Standards of visual aptitude cannot be established for all kinds of occupations simply by determining the degree of visual functional efficiency. Although this is an essential factor, *visual aptitude depends primarily on the nature of a specific job and the minimum degree of visual efficiency required for its effective accomplishment.* The problem of determining even visual aptitude alone is a complex one, requiring an analysis of all of the factors that relate to specific jobs. Therefore, to determine visual aptitude with some degree of accuracy it is found necessary to correlate all the variations in the technique of performance of all kinds of jobs and the specific demands

on the various qualities of vision which are necessary to meet these variations. Some jobs require a high degree of acuity, many do not, some require color vision, most do not, some require an accurate judgment of distance, most do not, many require depth perception, most do not, some require only near vision, others both, etc. We cannot discuss at this time either all the variations in jobs or the minimum visual requirements for specific jobs. However, these variations must be obvious. There is still much to be learned in this field, and many known facts need to be correlated in order to establish practical standards of visual aptitude for specific jobs.

Since acuity is the most important of these qualities of vision we shall give this quality brief consideration in order to call attention to some of the difficulties presented in attempting to establish reasonable standards. So far as acuity alone has influence on working ability for most occupations, one may make the general statement that a 20/40 acuity is the dividing line between good and efficient occupational vision and the beginning of visual inefficiency and that a 20/100 acuity is the dividing line between a serious degree of loss of efficiency and a total visual incapacity. However, in addition to acuity there are other visual factors that will influence occupational visual efficiency such as heterophoria, heterotropia, lack of fusional ability, eye dominance, possibly aniseikonia, and, for some occupations color blindness. Since every job does not require the same degree of acuity or other qualities of vision, visual requirements should be based on the minimum standards of vision found to be necessary for apt performance in specific occupations. Thus, these occupations should be classified in relation to the degree of visual efficiency necessary for working efficiency.

General classifications of jobs in relation to visual requirements have been made, but these are unsatisfactory, being too inclusive to be of value in the placement of most employees. For example, jobs are often classed as unskilled, semiskilled, and skilled, but this classification is not sufficiently specific. However, under this classification one may state that much common labor is aptly performed with an acuity of 20/200, that those employed in semiskilled tasks are apt with an acuity of 20/33 to 20/85, but that for the highly skilled operative in industry a binocular minimum acuity of 20/30 is necessary. For example, many occupations, such as inspectors, crane operators, operators of punch presses, and

those operating fast moving machinery or those in employment requiring the quick and accurate judgment of distance should possess a high degree of binocular efficiency in order to be safe and visually efficient. This generally requires, in addition to nearly normal acuity, the presence of stereopsis and a high rating for depth perception. To be a satisfactory aid in placement in the classification of jobs in relation to vision each class must be more restrictive. Some objection has been presented by labor to any classification of workers on a physical and mental basis, however, if jobs are to be found consistent with the degree of vision possessed by workers, classification of visual aptitude in relation to jobs is necessary for their proper placement.

Attempts have been made previously to divide types of employment into groups based on the degree of visual acuity thought to be adequate for each. But, as a rule, these have not divided occupations into a sufficiently large number of groups to meet the problem of proper placement. For example, Magnus and Wurdemann (*Visual Economics*, page 37) have divided all vocations according to visual demands into two groups, naming about 25 different vocations in each group. Dr. Culler has recently divided vocations into four general groups, the United States Civil Service Commission, in Circular Letter, Medical Series No. 37, *Standard Physical Requirements*, has listed five hundred field positions into thirteen groups. This "letter," which is a manual, is the best approach to establishing working standards for vision in relation to jobs. In it all positions have been carefully analyzed, and each field position has been considered from the point of all significant variation in physical abilities that might be required by a wide variety of positions, in each case making a careful analysis of the duties of the position. The manual states that it presents "a nucleus around which a comprehensive system of standard physical requirements can be built." This manual contains a list of the largest number of positions placed in the largest number of groups yet published. In each of these groups the minimum visual acuity considered adequate for the jobs listed is designated. Consideration is given to adequacy of near acuity as well as to color vision when a specific position demands these qualities of vision. This grouping is made on a basis of general physical health, visual acuity, and hearing. Only the minimum visual standard is required for the major proportion of the five hundred situations listed, and in only a

few is the maximum standard required. The minimum acuity standard in this manual is 20/30 (Snellen) in one eye only, glasses permitted. This is stated as follows:

"Vision—Vision must be at least 20/30 (Snellen) in one eye, glasses permitted, and at least 20/200 (Snellen) in that eye, without glasses, except that persons whose vision with glasses meets the requirement named above, but whose vision without glasses is less than 20/200 (Snellen) in that eye will be suspended, and they will not be eligible for appointment until satisfactory evidence has been presented to the Commission showing that there is no disease or defect of the eye other than an error of refraction."

The minimum acuity standard for positions requiring considerable skill is

"Vision—Vision must be at least 20/40 (Snellen) in one eye, and 20/70 (Snellen) in the other, without glasses."

And the highest standard set, which is for prison custodial positions only, is as follows:

"Vision—For applicants of 35 years or under, vision without glasses must be at least 20/30 (Snellen) in one eye and 20/40 (Snellen) in the other, capable of full correction to 20/20 (Snellen) in each eye. Applicants over 35 years of age will not be held to this standard provided the uncorrected vision is not less than 20/70 (Snellen) each eye capable of full correction to 20/30 (Snellen) each eye. Color vision must be normal."

Despite the fact that in my opinion these standards are the fairest yet published, there are a few designated positions for which the visual standard is too high. For example, a janitorial position could be aptly filled with a monocular acuity of 20/40 with correction. However, this manual, as it states, can be a "nucleus" around which there may be added many other specific jobs and a further division of visual requirements that may be found either adequate or necessary for efficient workmanship and safety in all fields of employment.

There is need for extending the investigations now being conducted by Dr. Kuhn and her co-workers along not only the line of "Eyes for the Job" but of jobs for the eyes. There should be a further coordination of visual aptitude and specific jobs. This will require the establishment of visual aptitude standards that will be adequate for every kind

of employment. Many positions can be classed together, but the classes should not be too inclusive or too broad. Standards on this basis have not as yet been established, but I trust they are in a formative stage of development.

My purpose in this paper is to ask for your interest and cooperation in aiding those who have some degree of subnormal vision in securing jobs for which they have adequate visual aptitude. Although one should advocate a high standard of vision for those positions where it is necessary for safety and for efficient production, the great majority of positions can be aptly filled by those who can meet minimum standards that are less than the highest. These potential employees should not be labeled as unemployable visual cripples but should be aided in securing that type of employment for which their vision is adequate.

There should be established by some authoritative medical organization, in cooperation with safety engineers, labor, and management, visual aptitude standards for specific positions or jobs. These standards should be the minimum consistent with the nature of the employment but should be sufficiently high to assure efficiency in production and safety to employees. The establishment of such visual aptitude standards will place many qualified employees in suitable and productive positions that are denied to them at the present time.

Discussion

Dr. Walter S. Atkinson, Watertown, New York—We are particularly fortunate to have such an outstanding authority as Dr. Snell present this most important subject dealing with the relationship of vision to occupational aptitude.

For some years we have had in our country what might be called an "Employer's Market"—that is, there has been so many unemployed that the employer has been able to pick and choose rather carefully and only employ those who were physically and visually fit.

Therefore, standards of vision for different occupations designed to place in employment men with defective vision probably have been, in a great measure, disregarded.

One cannot feel too critical toward these careful employers who have had to compensate employees for 50 per cent loss of vision when their sight has been reduced to 20/40 as a result of injury, since, as pointed out by Dr. Snell, the United States Army accepts these "half blind men" in Class 1-A and New York State allows them to drive a car. Employers will probably continue to choose quite carefully and be afraid

to do otherwise until a different and more reasonable attitude is taken

Let us place ourselves in the position of the employers with an abundance of material from which to choose. Would we intentionally select defective applicants with many normal ones available?

Today the conditions are changing rapidly from an "employer's" to an "employee's market," where the employee will be able to pick and choose. Most will agree that it is not ideal for either to be in a position to wield the whip too freely.

However, as we approach the time when there is no longer a great surplus of labor and when neither the employer nor the employee has the whip hand, then we must have some standard of occupational visual aptitude to follow—one that is fair to both the employer and employee.

Dr Snell has referred to the United States Civil Service Manual as the fairest yet published. However, a somewhat different standard may be desirable for private industry.

We are all familiar with Dr Snell's outstanding work regarding vision in industry. As you know, Dr Snell was largely responsible for the excellent formula for computing visual losses and the compensation for eye injuries which was approved by the A.M.A. in 1925 and is the accepted standard in many states.

The appointment of a similar committee, headed by Dr Snell with his extensive experience in this field, to draw up visual standards suitable for different occupations would be most opportune.

Dr James I. Farrell, *Utica, New York*.—I deem it a great privilege to have been given the opportunity to read and study Dr Snell's paper. As you all know Dr Snell has, for some time, been outstanding in trying to get some uniform standard of visual acuity and percentage loss of vision accepted by the various legislatures in the country. We should consider ourselves fortunate in having Dr Snell present this new study to us first.

The essayist has covered the subject so well that it is difficult to find much to add to it in this

discussion. It is possible that he includes visual fields in the term "occupational visual efficiency," but I feel that they should be more clearly emphasized. We all know of individuals who have 20/20 vision with hemianopia or who have 20/20 vision but whose fields are so contracted that they are a much greater hazard driving a car or a greater risk in a factory than some person with a 20/40 vision with normal fields. Even a one-eyed man with normal visual acuity and field is a far safer one to have around machinery than one with single binocular vision, a 20/15 vision in each eye, but with the small central field found in some people with retinitis pigmentosa.

I believe that it is important to stress the fact that "heterophoria, heterotropia, lack of fusional ability, eye dominance, aniseikonia, color blindness," and visual fields are as important to consider in accepting a man for specific jobs as is visual acuity alone. I know that in three of the foundries in Utica and in one paper mill and one brewery the pre-employment examining physician takes into consideration the job the man is going to do before he turns him down because of a visual defect. If men with one eye have had exceptional training or are hard to find for a particular job, there is no hesitancy about hiring them. However, in one of the largest plants in Utica rigid visual acuity requirements for distance and near have been set up, and nothing else is considered. If an applicant fails the acuity tests, he is not hired. Some of the employers require no eye tests at all.

It is quite obvious why managements do not want to employ monocular workers—if anything happens to cause loss of the single eye, it means permanent total disability. There are many jobs that these men can fill without much danger of an injury to the only eye, and it seems to me we should try to teach this to the laity.

I would like to ask Dr Snell how we can help in getting "jobs for the eyes," and also how we can help getting sensible and fair rulings from the compensation courts on the percentage loss of vision following an accident?

I wish to thank Dr Snell for his excellent paper.

TYPHOID CARRIERS

A total of 434 typhoid carriers, exclusive of those in state institutions, were under supervision in upstate New York at the close of 1940, reports *Health News*. Thirty-seven new carriers were added to, and 25 were removed from, the register during the year. Twenty-eight were discovered as a result of epidemiologic investigation of sporadic cases of typhoid—1 by means of release cultures, 1 as a result of routine food handler examination, and 2 accidentally discovered at time of cholecystectomy. Five previously discovered carriers were added to the register. Two of these had been residing tempo-

rarily out of the state, and 3 had returned to upstate New York from residence in New York City.

Of the twenty-five carriers whose names were removed from the register, 15 died. Six were released from restrictions after the submission of the required number of negative fecal and duodenal specimens following cholecystectomy, 1 was committed to a state institution, and the names of 3 others were removed because of change of residence of the carrier to a community outside the jurisdiction of the department.

THE PRACTICE OF RADIOLOGY

HENRY K TAYLOR, M D , F A C P , F A C R , New York City

CONSIDERABLE progress has been made in all branches of medicine. Radiology has not been backward in this respect, despite the fact that many obstacles have been thrown in its path particularly that branch which deals with diagnosis. The presentations before this section demonstrate some of the newer practices established in the fields of diagnosis and therapy.

Sixteen years ago in a decision of a non-medical case (*Sausser vs the New York City Health Department*) rendered by the Court of Appeals of the State of New York, the presiding justice made a side comment, which had no bearing on the case in question before him, to the effect that the interpretation of roentgen films was not to be considered as the practice of medicine. This has permitted many inroads into the practice of roentgenology by untrained and unqualified lay individuals. Organizations and corporations also took advantage of this situation—some with and some without ulterior motives for profit, some rendering a valuable service, and others rendering a service that is of little or doubtful value. Even though the Medical Practice Act states that anyone who holds himself out to diagnose and to treat is *practicing medicine*, legal minds have held that the diagnosis concluded from a roentgen examination is not to be construed as the practice of medicine. This is an awkward situation, for you and I know differently. Efforts directed at the Educational Department and the Legislature of the State of New York have failed to correct this awkward situation. These efforts have been met with a variety of barriers and resistances which are almost insurmountable. Even the 1940 session of the Legislature, which adjourned on March 29, failed to correct this situation.*

I believe it is timely for an educational campaign to correct the above-mentioned condition to be directed to the medical profession, and to the public, stressing the following:

1 Radiology is a special branch of medicine which deals with diagnosis and treatment of diseases by means of roentgen rays and

radium. A roentgen examination is a diagnostic procedure that requires considerable knowledge and skill. These facts are acknowledged by the local, state, and national medical societies and health agencies.

2 Anyone engaged in this special branch of medicine is practicing medicine. This special branch of medicine should not be usurped by lay individuals, organizations, or corporations. Legally, only individuals, not organizations, are licensed to practice medicine.

3 The public and the medical profession should be taught that a roentgen examination belongs to a specialized field of medicine. A roentgenogram is not a photograph, nor is it a picture. The term picture should not be used by the medical profession. The interpretation of a roentgenogram is not self-explanatory, nor is it obtained in the developing solutions. It requires considerable postgraduate training.

4 Interpretations of roentgenograms should be made by doctors who have had adequate training in radiology and by other physicians who have specialized training in the roentgen diagnostic aspects of their specialties.

5 The American Board of Radiology certifies doctors qualified in radiology.

I should like to call your attention to a recent Mississippi court decision, sustained on appeal, permitting an *x-ray technician* to make a diagnosis of a fracture of the spine from roentgen films but not permitting him to state the cause for the fracture. Here is an instance where again a judge ruled, permitting an *x-ray technician* to make a diagnosis. This court action further brought out the interesting fact that the *x-ray technician* was interpreting, diagnosing, all the films of the roentgen examinations made in the hospital where he was employed. Would the medical staff of which you are a member permit a situation of that kind in your institution? Incorporated in a recent revision of Section 7 of the "Essentials for a Registered Hospital," which was adopted by the House of Delegates of the A.M.A., was the following: "The responsibility for all radiologic examinations must rest on the physician-roentgenologist who is head of the department." It seems to me that in an educational campaign as mentioned above we

Chairman's address. Read at the Annual Meeting of the Medical Society of the State of New York, New York City, May 6, 1940.

* The Radiology Bill met with no success in the 1941 session of the Legislature.

should direct our efforts vigorously in directions that will interest our medical staffs, our hospital superintendents, hospital boards of trustees, judges, lawmakers, social and welfare organizations acting as auxiliaries to the medical profession, and perhaps one of our own county societies

At the annual meeting of the A.M.A. in 1938, the Council of the A.M.A. passed a set of resolutions, pertaining to the renting of radium. These resolutions have been approved by the national radiologic societies, the American Radium Society, and the Inter-Society Committee for Radiology. One of the resolutions which I believe of considerable interest, one that you all should know and should disseminate as part of the educational campaign, is that it is unethical for any physician who has not had the privilege of examining a patient to prescribe or direct the use of radium. I believe the above statement should be heeded by those who inadvertently are guilty of such practices and are not aware of the fact that this is unethical.

The generation and utilization of roentgen rays are not attendant without dangers. Qualified radiologists know of the dangers and know how to protect their patients, themselves, their employees, and neighbors from them. I know of no instance within the past fifteen or twenty years where a radiodermatitis developed in a well-trained individual. If a dermatitis did develop, I am certain he or she would attribute it to his or her own negligence or carelessness. We have profited by the unpredictable and unfortunate experi-

ences of the pioneers in radiology. Had they had the knowledge of the measures of protection which we have, I am certain that many of them would be here with us today, with limbs sound and intact.

Recently, there was newspaper publicity portraying a shocking accident, the result of manipulation under a fluoroscope. It is my impression that the accident could have been avoided. I believe it occurred because there was insufficient knowledge on the part of an overzealous surgeon in using a dangerous modality. A word of caution is necessary at this time to the untrained in the use of a dangerous modality, since there is a greater tendency on the part of many clinicians and specialists to employ fluoroscopy and roentgen procedures as an aid in the diagnosis of diseases.

The indiscriminate and prolonged fluoroscopic examinations by the untrained will react to the discredit of radiology. The radiologists should instruct their medical confreres of the dangers attending fluoroscopy and how to avoid them. A word of caution is especially directed to the surgeon who, in his anxiety for a perfect anatomic result of a fracture set under the fluoroscope, desires another and another and still another observation. Each succeeding observation carries an additional danger.

The above indicates the necessity for a comprehensive educational campaign directed in such a manner that it will benefit and protect the doctor as well as the public.

667 Madison Avenue

NURSE PRACTICE LAW AMENDED

Governor Lehman has signed the Todd amendment to the Nurse Practice Law, thereby granting an extension of time for nurses to apply for licenses. Applications for license as either graduate or practical nurse will be received by the State Board of Nurse Examiners until July 1, 1941.

This measure was sponsored by the Legislative Commission to Formulate a Long Range Health Program for New York State. Many nurses, both graduate and practical, who failed to make application under the present law have wished to apply for their licenses. It is to give these nurses, who may have the qualifications required by law, another opportunity to apply for licenses, that the time extension has been given. Qualified out-of-state graduates may also make application to try New York State Board examinations.

All applications must be filed with the Board

of Nurse Examiners by July 1, 1941. This extension will give the Board of Examiners a brief period in which to finish reviewing the applications now on file and those which will come in between now and July 1. The Nurse Practice Law will thus work no hardship upon qualified nurses whose applications have been filed but who may not receive licenses by July 1 of this year. Under this amendment they may continue to nurse for hire during the period of waiting for final action upon their applications.

Every nurse who wishes to continue the practice of her profession is urged to complete her application and file it with Miss Stella Hawkins, Secretary of the State Board of Nurse Examiners, Albany, New York, by July 1, 1941. After that it will be too late. Everyone who knows a nurse who has not yet made application for her license is requested to call her attention to this article.

CONTRAST CINEROENTGENOGRAPHY OF THE CIRCULATORY ORGANS

WILLIAM H STEWART, M D , C W BREIMER, M D , and HERBERT C MAIER, M D ,
New York City

ONE of the most important advances in roentgenology in recent years is the technic developed by Robb and Steinberg for the visual demonstration of the cardiac chambers and great vessels. Following the rapid intravenous injection of a 70 per cent solution of diodrast, a portion of the blood stream is rendered temporarily roentgen-opaque, and the opaque fluid can be followed in its progress through the heart, lungs, and great vessels. This work has added much to our knowledge of the anatomy, physiology, and pathology of the central portion of the circulatory system. The technic of this intravenous method has been clearly set forth by Robb and Steinberg [Am J Roentgenol 41 1-17 (Jan) 1939], and no attempt will be made to redescribe it here.

With ordinary roentgenographic equipment it is possible to obtain only about two films of the heart and lungs in the interval between the introduction of diodrast into the antecubital vein and the time when the shadows disappear owing to the passage of the diodrast from the heart and great vessels. Variation in the speed of the progress of the opaque material through the circulatory organs and lungs in pathologic conditions adds to the difficulty of exactly timing the film exposures to show the structures desired. This difficulty has been largely overcome by predetermination of the circulation time by cyanide and ether tests.

Recently, we have successfully applied cineroentgenography in connection with the injection technic of Robb and Steinberg. The usual cineroentgenographic equipment was used and exposures were made at 16 frames a second. In a ten-second exposure 160 successive films were made showing the progress of the injected material. From this strip of film, made into a loop, multiple prints were made which, when projected, give a permanent record of a considerable portion of a circulatory cycle and faithfully reproduce the appearance present on the fluoroscopic screen.

Briefly, the following series of events is observed. The injection into one of the antecubital veins is made simultaneously with the

onset of deep inspiration. The opaque medium, 40 cc of 70 per cent diodrast, forms a solid column in the subclavian and innominate vein and superior vena cava which reaches the heart in about one second and then delineates the right auricle and ventricle. In the normal person two seconds later it enters the pulmonary arteries, the appearance resembling the "star burst" of a fireworks display in its sudden spread, gradually fading as it leaves through the pulmonary veins. Normally, about five seconds from the time of injection, although somewhat diluted, the medium enters the left auricle and ventricle and then outlines the aorta within eight seconds from the time of injection.

For the production of satisfactory films, whether single or runs, care must be exercised in the selection of subjects. They must have veins that will readily accommodate the large cannula. The subject must not be too thick-chested or otherwise resistant to the x-ray and must be able to remain in the erect position with arms elevated for a period of at least ten minutes. Relative freedom from anxiety is also desirable to insure smooth progress of the procedure.

Robb and Steinberg have shown that there is little if any danger connected with the injection of the required large doses of diodrast. The common discomfort complained of is a feeling of warmth shortly following the injection and infrequently some nausea and vomiting. Occasionally, the patient suffers from a urticaria, which shortly disappears. Some patients have a phsyic effect with faintness which, with moral persuasion and rest in the recumbent position, soon disappears. An indication that the procedure is not particularly disagreeable is demonstrated by the fact that several patients have voluntarily permitted more than one such examination.

In general, the two most important positions for cineroentgenographic studies of the intrathoracic circulation are a direct postero-anterior position, showing the entire chest to demonstrate the right heart and pulmonary circulation, and a left anterior oblique study, showing only the heart and aorta to demonstrate the separate cardiac chambers and the aorta without superimposition.

Read at the Annual Meeting of the Medical Society of the State of New York, New York City, May 6 1940

When diodrast is injected into the veins of the arm it reaches the superior vena cava and right auricle in about one and one-half seconds, the right ventricle and pulmonary circulation is three to six seconds. It will be seen from this that with an available exposure time of eight to ten seconds the ether test for pulmonary circulation time will not be necessary since this phase can be covered by one exposure in all cases. A movie run starting not more than one second after the injection of the diodrast will show the right auricle and ventricle as well as the filling and emptying of the pulmonary circulation.

When a second injection is to be done to show the left ventricle and aorta, it is necessary first to determine the circulation time by the intravenous cyanide method. When a cyanide solution (0.3 to 0.45 cc of 2 per cent solution) is injected, a period of hypernea results, beginning when the cyanide reaches the carotid sinus. By noting the period between the injection and the onset of hypernea and subtracting about two seconds, the optimum time for study of the left ventricle and aorta is obtained.

For example, if the circulation time from the arm to the carotid sinus is shown to be twelve seconds, the optimum time for visualizing the left ventricle will be ten seconds after injection. An eight-second exposure starting six seconds after the injection of the diodrast will show the entire progress of the opaque medium through the left heart and aorta.

The cineroentgenographic results will not be satisfactory when the heart is dilated because the volume of intracardiac blood is so great that dilution of the opaque medium in the heart prevents proper visualization of the chambers.

We are giving no detail of our cineroentgenographic technique, since it has already been published in detail [South Surgeon, 9: 21-25 (Jan.) 1940]. The only change we have made recently is the use of a faster film. We are now using Agfa superpan supreme or Eastman Super XX. Both films are much more satisfactory than those we originally used.

The cineroentgenographic examination provides quite a thrill. A successful result depends upon every detail being carried out accurately and on time. Four factors must start at the same instant: full inspiration on the part of the patient, injection of the opaque medium by the medical assistant, the running of the camera by the photographer, and the energizing of the x-ray tube by the roentgenologist.

When the heart and great vessels are studied by the cineroentgenographic method after opacification with diodrast, much information may be obtained. The cineroentgenographic recording supplements the information obtained from films. Although it is not possible by present methods to obtain the same detail of structures that can be obtained with the film, there is the advantage of visualizing the entire cycle through the great vessels and heart. For this latter reason it is sometimes possible to depict abnormalities not shown on roentgenograms. The cineroentgenographic method also gives a graphic presentation of the circulatory dynamics. The method can be used for teaching purposes. To date, by this procedure, cineroentgenographic demonstration of the following has been obtained:

- 1 Disturbance of blood flow through the great veins
- 2 The actual size of the pulmonary artery with its variations and deformities such as aneurysm, constrictions and displacements
- 3 The shadows of the pulmonary circulation with particular demonstration of the vascular component of the hilar shadows
- 4 The cardiac chambers with demonstration of the actual thickness of the ventricular walls. The abnormal contracture of the wall of a cardiac aneurysm
- 5 The demonstration of a defect in the septum between the right and left cardiac chambers
- 6 The visualization of some of the types of defects present in congenital heart lesions
- 7 The demonstration of aneurysm of the heart and greater blood vessels, as well as deformities, angulations, and displacements of the circulatory system in the chest caused by pathologic processes

The authors acknowledge their indebtedness to Drs. G. P. Robb, I. Steinberg, and U. J. Roche for their assistance.

Discussion

Dr. Marcy L. Sussman, New York City.—The most sincere compliment to a scientist is imitation. Following the explicit directions published by Robb and Steinberg and the excellent moving-picture demonstration made by Dr. Stewart in Chicago last year, Dr. M. F. Steinberg, Dr. A. Grishman, and I, of the Mount Sinai Hospital, have been successful in duplicating the results reported here. We have modified the technique slightly to suit our available apparatus. We think that the use of a rotating target tube enhances the detail. As a result, instead of a continuous exposure of ten or twelve seconds

In general, the two most important positions for cineroentgenographic studies of the intrathoracic circulation are a direct postero-anterior position, showing the entire chest to demonstrate the right heart and pulmonary circulation, and a left anterior oblique study, showing only the heart and aorta to demonstrate the separate cardiac chambers and the aorta without superimposition.

A NEW ANGLE ON TRIGEMINAL NEURALGIA

A Study of 245 Cases with Observations on Seasonal Occurrence and Surgical Technic

HENRY WARD WILLIAMS, M D , F A C S , F I C S , Rochester, New York

DURING the past seventeen years I have personally treated 245 cases of true tic douloureux. These have not been previously reported, and the following statistical account and certain facts that have been observed in the course of study are here presented. The symptomatology of the disease shall not be discussed and, since the cause of trigeminal neuralgia has not as yet been established, mention of this will also be omitted.

Trigeminal neuralgia has been known to the medical profession since Fothergill's classic description in 1773. During the past fifty years efforts to treat this disease have been progressively more successful.

The principles of treatment are simple—namely, anything that interrupts the sensory path from the face to the brain is sufficient to arrest the disease. If the point of interruption is distal to the gasserian ganglion, relief will be temporary and the pain will recur, if it is proximal to the ganglion, relief will be permanent. The quickest method is injection of alcohol in the affected branches of the trigeminal nerve. Another method, not so reliable, is administration of trichlorethylene by inhalation. The surest method for permanent results is surgery.

Early surgical attempts, which included removing the ganglion or evulsing peripheral branches of the fifth nerve, were not always satisfactory since there was a high mortality in complete resection of the ganglion, while evulsion of the peripheral nerves gave results that were not so prolonged as the injection of alcohol.

Modern surgery of trigeminal neuralgia originated in 1901 when Spiller devised and Frazier¹ first performed the operation of interrupting the connection between the gasserian ganglion and the brain. This simplified the operative procedure and today there are three courses of surgical approach—namely, the temporal approach of Frazier, which is the method used in all but 1 case in this report, the posterior approach of Dandy², and tractotomy, which was created by Sjökvist and developed by Rowbotham.³ The pros and

cons of the various surgical approaches would occupy an entire paper in itself so they will not be discussed here. Even though these three procedures are standardized, application of them varies according to different clinics.

This group was chiefly drawn from a densely populated section of the country where treatment of trigeminal neuralgia was formerly not available and where attempts at surgery, in this locality, were few, and because they were unsuccessful they gave the "tic operation" a bad name. This group offers a better cross section of the disease than would be available at any large clinic where patients would come from hundreds of miles after their disease had fully developed into a longstanding case of neuralgia.

In my experience I have found that few cases of trigeminal neuralgia are referred by physicians, while the largest number are referred by previously treated patients or by dentists. Those who have been sent to me by the "tic veterans" seem to realize thoroughly that permanent relief can be obtained only by surgery, and, therefore, they request immediate operation, usually refusing preliminary injections when suggested to them. If a new tic lacks information, however, and has had no contact with persons who have experienced surgical treatment for this disease, I usually inject them as an initial procedure, this relieves them promptly and by the simplest method. By proceeding in this manner I find that I am compensated by having these patients immediately put at ease, and they are no longer difficult problems to handle (this is often a psychologic angle that we encounter in persons suffering from "the pain"). To obtain prompt and satisfactory results I have avoided extensive preparations that might disturb the patient and have injected that branch of the nerve nearest the trigger point, either deep or superficial, rather than always attacking the main divisions at their point of emergence from the skull as I formerly did. If this does not bring immediate results, further injections are done until the trigger point is anesthetized and the pain, therefore, relieved. This enables the patient to become well acquainted with the numbness and various sensations that constitute the ultimate

Read at the Annual Meeting of the Medical Society of the State of New York, New York City, May 7, 1940.
From the Highland Hospital.

such as Dr Stewart makes, we have to limit ourselves to two consecutive exposures of three or four seconds.

The injection method of Robb and Steinberg appears to be perfectly safe. We have made between seventy and eighty injections with no untoward results, aside from transient discomfort. A noninflammatory sclerosis of the injected vessel occurs in a small percentage of cases.

The moving-picture method has obvious advantages over the two- or three-roentgenogram method, chiefly because it provides a continuous and dynamic recording. The difficulty of timing exposures to show desired structures is eliminated. In addition, direct observation of the screen can be made during cinematography which also contributes to a better interpretation of the

results. The major disadvantage is loss of detail and, to some extent, loss of contrast.

The question of the practical value of the contrast visualization of cardiac chambers and great vessels is now under intensive investigation. The great vessels, as Dr Stewart has indicated, are easily and completely visualized. Undoubtedly, differentiation of mediastinal tumors, for example, has been made more sure. The value of the method in cardiac disease, however, will probably lie in the better understanding of the underlying pathologic physiology rather than in marked improvement of clinical diagnosis. It is in this field that the motion-picture recording is likely to find its greatest application. Dr Stewart's presentation is an inspiring and pioneering illustration of the method.

SECOND AMERICAN CONGRESS ON OBSTETRICS AND GYNECOLOGY

The Second American Congress on Obstetrics and Gynecology will be held in St. Louis, April 6 to 10, 1942. All of the meetings and both the commercial and educational and scientific exhibits will be held in the Public Auditorium.

The various committees have been set up and the following chairmen have been appointed: Executive Committee, Dr Fred L. Adair, Chicago; Program Committee, Dr E. D. Plass, Iowa City; Motion Picture Committee, Dr Robert D. Mussey, Rochester, Minnesota; Educational and Scientific Exhibits, Dr H. Close Hesselstine, Chicago; Commercial Exhibits, Dr Philip F. Williams, Philadelphia; Lay Publicity, Dr Joseph L. Baer, Chicago; Professional Publicity, Dr George W. Kosmak, New York City; Publications Committee, Dr Goodrich C. Schauffer, Portland, Oregon; Evening Meetings, Dr Robert L. DeNormandie, Boston; Membership Committee, Dr Buford G. Hamilton, Kansas City, Kansas; and Budget and Finance Committee, Dr William C. Danforth, Evanston, Illinois.

The general plan for the program will be much the same as that of the first Congress, which was

held in Cleveland, September 11 to 15, 1939, with sectional meetings for the various groups (nurses, public health administrators, educators, and physicians), general sessions for all members attending the Congress, and round tables. There will be evening sessions open to the public.

Adequate time for registration will be given the first day before the opening of the sessions of the Congress. Admission to the Congress will be by individual membership card only. These may be secured by payment of the registration fee (\$5.00) any time after September 1, 1941.

At the suggestion of the Medical Exhibitors Association, more time will be allowed for the members of the Congress to visit the exhibits. The response to a letter sent to the firms handling products of interest to our group telling them of a second Congress has been excellent, and we are assured of an excellent Commercial Exhibit.

The hotel headquarters have not been assigned to the various groups as yet, but the Medical Section and General Congress Headquarters will be in the Jefferson Hotel.

For further information, apply to the Chicago office of the Congress, 650 Rush Street.

ELECTROCARDIOGRAPHY

The Michael Reese Hospital, Cardiovascular Department, offers a full-time intensive course in Electrocardiography from August 18 to August 30, 1941, by Dr Louis N. Katz, director of cardiovascular research.

This is an intensive course offered to the general practitioner. There will be practice on several electrocardiographic machines and discussion of the principles of their construction and use. There will be sessions on interpretations of electrocardiograms illustrated by lantern slides, and practice by the student with unknown records. Routine records taken during the time of the course will be discussed. Emphasis will be placed on chest leads and on the importance of the electrocardiogram in coronary

sclerosis and myocardial infarction. The mechanism and interpretation of heart irregularities will be developed.

As group and individual instruction will be given, the course is open to both the beginning and advanced student in electrocardiography. It is planned to individualize the course so that at the end of the period each student will be capable of taking and properly interpreting routine electrocardiograms. In order to accomplish this purpose the class will be limited in number. It is imperative, therefore, that reservations be made early. For further information address Michael Reese Hospital, Cardiovascular Department, 29th and Ellis Ave., Chicago, Illinois.

operative day In 19 cases the entire sensory root was removed and in 83 the lower two-thirds Early in my practice, in those cases where the entire root was removed, 4 patients developed corneal ulcers, but in the last ten years we have successfully avoided this complication. In fact we no longer warn patients of this danger Avoidance of corneal irritation is achieved by dividing the root close to the ganglion, not according to Dandy who resects the root close to the pons This method ensures, in almost every case, accurate anesthesia, inclusive, of the lower lid, while the upper lid will have sensation and the cornea will remain sensitive

Two surgical deaths are reported, both were caused from intercranial hemorrhage following operation There were 2 cases of temporary facial paralysis One case of total ophthalmoplegia on the side operated upon fortunately recovered in three months The other case of temporary hemiparesis following an injection that accidentally penetrated the carotid artery also recovered (Since this experience I have made it a practice, before injecting alcohol, to draw on the syringe plunger to note if blood can be sucked out through the needle and to always inject a small amount of novocain before alcohol every time the needle is moved) Another patient who three years after surgical treatment had a recurrence of tic, apparently due to incomplete removal of the lower part of the root, was operated upon a second time with satisfactory results

Trichloroethylene was used in a number of cases but proved effective in only 8 It does not seem to be so useful in chronic neuralgia as in acute neuralgia Two cases refused all treatment, I was so alarmed by the prospect of injection or surgery that she committed suicide. The remaining have all received injection treatments, including those who were poor surgical risks or were very old and a number of others who have been injected once or twice and will eventually come to surgery

Of the 245 patients reported in this paper 109 have to date come to surgery—44.5 per cent Of a group totaling 1,317 patients treated by Frazier,⁴ reported in 1931, 654 were operated upon—49.6 per cent

A careful study of this series in an endeavor to determine to some extent the behavior of trigeminal neuralgia brought to light these facts the disease is more prevalent among women and it affects the right side of the face far more frequently The proportion is far more frequently The proportion is far more frequently The proportion is far more frequently The proportion is far more frequently women, 160, men, 85, right, 148, left, 90 (in

3 cases the side affected was not recorded)

There were 6 patients with involvement on both sides, one was treated bilaterally by injections, 4 were operated upon on one side (1 elsewhere) and injected on the other, the sixth case, previously mentioned in this report, was operated upon on both sides

There seems to be no relation between right- and left-handedness in connection with the side of the face affected in these patients, although the information available in this factor is contained in only a few of the records It did not occur to me to consider this point until recently

The divisions that were affected are as follows first alone, 17, second alone, 77, third alone, 41, second and third, 83 The total with pain in the second division is 160, the total with pain in the third division is 124 In the remaining cases patients did not specify the exact location of pain. Those with second and third division pain were operated upon by the temporal route, and this method will be continued in the future Only 5 of the first-division cases were operated upon—4 by total resection of the root and 1 by tractotomy In the future all patients having pain confined to the first division will have tractotomy

Seasonal Occurrence

I have noticed for a number of years that during certain months more persons came to me seeking relief from the pain of trigeminal neuralgia than at other times of the year Pursuant to this observation we have recently made a careful study of all records of patients I have treated My first impression, based only on recollection of being particularly busy with cases of *tac douloureux* in the early spring and again in the beginning of fall, proved to be a fact after we had surveyed all my filed records It became apparent that more patients suffering from this disease came to me in the months of March and October We further observed, on the other hand, that noticeably few came in the months of February and August We then attempted to determine whether there existed a definite "season" wherein trigeminal neuralgia is most violent To determine this it did not seem proper to use the operative dates, because, in too many ways, varied factors would cause surgery to be delayed for brief or extended periods The date on which each patient first required my services was established as a fairly reasonable mark by which to gauge the possibility of a "season" for tics Accordingly, the case records were classified to concur with these first

Fig 1 Patient after subtotal resection of both sensory roots showing zone of anesthesia

cure Future course of treatment is then discussed with them, and they are told that they should be operated upon at the first recurrence. Patients should be informed that the average injection lasts a year, that it may be repeated several times but that it cannot produce an eventual permanent cure, and that repeated injections are only effective for fifteen years at the longest. In this series, however, there were 2 patients in whom one injection lasted over ten years.

Although the disease is more prevalent in persons of middle and advanced age, I have had a number of cases in persons younger than 40. Patients belonging in this group have always been injected first, to conform with the general rule of relieving as expeditiously as possible, also because their span of life may be assumed to be sufficiently long so that when surgery appears to be imperative they should still be good risks. Patients in the higher age brackets, i. e., those over 80 who are not good surgical risks either because of their age or other physical conditions, are also treated by injection. Notwithstanding this, very old persons may be in excellent condition and, if so, are operated upon at once. Between the ages of 60 and 80 it is wiser in healthy persons to operate immediately upon seeing them. If a course of injections is once commenced, it is difficult to persuade the patient, and particularly the relatives, that operation should be performed. Relatives then claim that the patient is too old and cannot stand surgery so they insist on a continued course of injections. When the effects of alcohol injections perforce wear out at the end of a period of

TABLE 1

Total patients	245	Operations 102

years, the patient is usually still alive and an operation has to be done on a person nearing the age of 90 or at least prone to the infirmities coincident with old age. We feel that we should not be required to operate on such patients when this can be avoided much earlier. Our only 2 surgical deaths came in this category.

It will be noticed in Table 1 that the large majority of persons with *tac douloureux* came for relief between the ages of 50 and 79, inclusive, while the greatest number operated upon were between 50 and 69, inclusive. In other words, we try to avoid having a sufferer pass the age of 80 without having had the benefit of surgery.

This group of 245 cases includes 109 patients who came to surgery for relief and represent a total of 110 operations—102 done by me and 8, treated by me, who were operated upon elsewhere.

One man had neuralgia on both sides and was first operated upon on the right side (Fig 1). Two years later, because injection treatment of the other side had become ineffective, a subtotal resection was done on that side also. This resulted in complete relief of pain. Fortunately, the motor roots were intact on both sides, and the only inconvenience that this man has since experienced is the inability to test temperatures by mouth, he has been obliged to use his fingers to determine the heat of foods and beverages to avoid burning his throat. Also, he cannot be sure that his mouth is entirely closed. Another patient with pain in the first division was relieved by tractotomy after two transtemporal operations had failed to produce results. With the exception of this case all these operations were done by me by the transtemporal route. The technic employed is similar to Frazier's but differs in that we usually use avertin anesthesia and, surgically, the root is divided close to the ganglion. Like Frazier's, this operation is done with the patient in a sitting position, further, the patient is allowed to get up on the third day and, as a rule, is discharged on the sixth post-

operative day In 19 cases the entire sensory root was removed and in 83 the lower two-thirds Early in my practice, in those cases where the entire root was removed, 4 patients developed corneal ulcers, but in the last ten years we have successfully avoided this complication. I have noticed for a number of years that during certain months more persons came to me seeking relief from the pain of trigeminal neuralgia than at other times of the year Pursuant to this observation we have recently made a careful study of all records of patients I have treated My first impression, based only on recollection of being particularly busy with cases of tic douloureux in the early spring and again in the beginning of fall, proved to be a fact after we had surveyed all my filed records It became apparent that more patients suffering from this disease came to me in the months of March and October We further observed, on the other hand, that noticeably few came in the months of February and August We then attempted to determine whether there existed a definite "season" wherein trigeminal neuralgia is most violent To determine this it did not seem proper to use the operative dates, because, in too many ways, varied factors would cause surgery to be delayed for brief or extended periods The date on which each patient first required my services was established as a fairly reasonable mark by which to gauge the possibility of a "season" for tics Accordingly, the case records were classified to concur with these first

FIG 2

dates There were twelve records in which the first date could not be determined accurately enough to be used Graphic representation of these findings is shown here (Fig 2) It may be observed that there are two high points—March and October—and two low points—February and August At present I have no explanation for this phenomenon

It is reasonable to suggest that any one of these factors—the seasonal occurrence (based on time of needed pain relief), the superiority in numbers of both women and right side that are affected by the disease, compared to the respective sex and side, as well as probably other facts yet unknown—may have a definite bearing on the etiology of trigeminal neuralgia

Conclusions

Two hundred and forty-five cases of trigeminal neuralgia are reported The disease is much more prevalent on the right side of the face It is also much more prevalent among women than men If accurate differentiation in the part of the root resected is adhered to, no corneal ulcers will occur If severe pain in the first division occurs, tractotomy is the operation of choice There is a definite seasonal incidence to the disease, with major peaks in March and October and low points in August and February No explanation for this is here advanced

Discussion

Dr Byron Stookey, New York City—I am interested in the seasonal character of the disease in this report, and I offer my own statistics for Dr Williams to go over to determine what their incidence may be I agree with Dr Williams that the temporal route is the best approach, and that the operation devised by Dandy is not so safe as, and no more satisfactory than, the former I disagree with him in regard to injections I feel that all cases of trigeminal neuralgia need surgery and that they should be pressed by the doctor to accept it The patient who has been treated for a long period of time by alcohol injections is a pathetic figure. I agree, however, that very old persons or those who are poor surgical risks should be treated by injection. In other words, alcoholic injections may sometimes be useful but only in a restricted sense

I do not agree with him in the case of bilateral differential section of the second and third divisions. The proprioceptor sense is not lost when the sensory roots are cut and the man could have determined whether his jaw was open or not

Dr Wallace Hamby, Buffalo, New York—I have heard Dr Frazier's scrub nurse mention that tic operations piled up at certain times of the year This concurs with the possibility of a seasonal incidence of tic I am very much interested

I am sure that the proprioceptor sense is retained in bilateral resection of the sensory root of the fifth nerve. The next case of bilateral neuralgia which I see will be treated surgically by bilateral tractotomy

I do not think that injection treatments for the disease have much to offer

I have lost 1 case—that of an old lady who had an area of thrombosis in the hypothalamic region of the brain at operation which appeared at autopsy, although during surgical procedure the blood pressure did not indicate this

Dr Henry Ward Williams (Concluding Remarks)—Dr Stookey's statistical figures for seasonal occurrence would undoubtedly enlighten us a great deal and should prove most interesting

When I stated that the man who had undergone bilateral subtotal resection of the sensory roots did not know whether his mouth was open or not I should have specified "lips" because, as a matter of fact, he does know at all times where his jaw is. I am quite sure that if Dr Stookey will test the bilateral resections he has done he will find the same condition exists

As I stated previously, my cases come from less distant places or are not so advanced in the disease as cases Dr Stookey is more apt to see, so frequently it is necessary to inject them at least once before being able to persuade them to submit to surgery

AMEBIC DYSENTERY AS A COMPLICATION IN THE DIAGNOSIS OF CARCINOMA OF THE RECTUM

ARTHUR A. LANDSMAN, M D, New York City

IN LOOKING over the literature one is struck with the scarcity of cases in which amebic dysentery and carcinoma of the rectum occur simultaneously in the same person.^{1,2} A diligent search of both American and foreign sources for the ten years between 1929 and 1939 brings out the amazing discovery that only 15 such cases have been reported during this period.³⁻¹¹ This is certainly unusual considering that there is no evidence of any natural antagonism between them. It is hard to believe this of two diseases that are individually so common and that have been so thoroughly thrashed out in every feature by both clinician and research worker. Carcinoma is a common disease in all parts of the world, it invades the intestinal tract of both sexes indiscriminately, and race and social condition bear no relation to its frequency. Age does not bar malignancy because it may occur in early life, and amebic dysentery has likewise been found in very young people and even in infants. Amebiasis is no longer looked upon as a disease of the tropics since it is found in all of its forms in the temperate zones, as witness the Chicago outbreak at the World's Fair in 1933 and others. We are not now concerned with the cases of pseudocancer complicating amebic dysentery, the so-called amebic granulomas of the large intestine, numerous instances of which have been reported by Gunn and Howard,¹² Gouchard and Paponnet,¹³ Desjardins,¹⁴ and Uzac and Timbal.¹⁵ Nor are we concerned with tumors that mimic malignancy in their gross structure but are composed essentially of coils of gut matted together by plastic exudation, thrombosis of vessels, edema, and other manifestations of inflammatory reaction. At this time we are only interested in true instances of the co-existence of the two diseases, both occurring in the same individual at the same time.

When a patient complains of a discharge of blood and pus from the rectum, marked constipation or copious diarrhea, loss of weight, and anemia and when the sigmoidoscopic picture shows an ulcerative coloproctitis, the natural conclusion is to suspect some form of dysentery. If, added to this, there is a

history of exposure such as a visit to a suspicious area and if the microscopic examination is positive for *Endamoeba histolytica* the diagnosis is established. But here is the crux of the matter. Is there anything in these premises which would exclude carcinoma of the large bowel? Not at all. It is not enough merely to make an affirmative diagnosis of the presence of one disease, one must be prepared to prove that there is no other condition that could produce the same symptoms. Obviously, the patient may have amebic dysentery while at the same time be subject to intestinal malignancy, since all the symptoms of one may be present in the other except those that are purely objective. Fortunately, it is not difficult to solve this problem if only such a possibility is borne in mind and if a thorough local examination is made including x-ray of the colon. Cases of dual diseases in which one or the other has been missed are essentially due to incomplete diagnoses which are avoidable with proper care and are not necessarily due to failure of a co-existence of the two conditions. The object of this communication is to emphasize this and to review one such case that we had under observation.

Case Report

A married woman, aged 52, whose previous and family histories were negative except that two sisters died of carcinoma at an early age, was first seen in February, 1933. She complained of attacks of diarrhea alternating with periods of constipation, distention, pyrosis, gastrointestinal distress, discharge of pus and mucus, tenesmus, and bleeding from the rectum, all dating back four months following a visit to friends outside of the city. A diagnosis of colitis was made by the physician in her home city on the basis of these symptoms, and she was treated by diet, irrigations, and internal medication without success. Inquiry into her history disclosed that she had been to Chicago during the World's Fair in 1933, four months before the onset of her illness. She was hospitalized, and an examination of the stools disclosed organisms definitely identified as the *Endamoeba histolytica*. She remained under treatment at the hospital with carbarsone, an arsenical preparation, orally and in retention enemas. Her diet was restricted and supportive treatment given. After six weeks she was discharged and came in for a follow-up, but no amebae were recovered after this. Some months later, because the symp-

From the Proctologic Service of the Jewish Memorial Hospital.

toms still persisted and to save the inconvenience of travel from her home, she consulted a local doctor who, after learning of her amebic infection, took it for granted that she had a return of her old trouble and treated her accordingly for several months. She failed to improve and returned here. Upon sigmoidoscopic examination, confirmed by x-ray and biopsy, she was found to have a malignant growth at the recto-sigmoid. Though no amebae were found at this time, we felt satisfied from the history and circumstances that she still harbored the infection, since it is not uncommon that the organisms may become quiescent for a time. It is possible that had the doctor not been misled by the previous history and had there been a more careful work-up in the first instance the growth might have been discovered by digital and sigmoidoscopic examination, if not beyond reach, or by x-ray if higher up.

Summary

A patient with a previous history of amebic dysentery returned with a similar complaint months later to another medical man and was treated unsuccessfully on the assumption that this was a recurrence of her former trouble. The question of the presence of carcinoma of the rectum was not considered at that time. Sigmoidoscopic examination, undertaken later elsewhere, disclosed advanced carcinoma.

Conclusions

All cases of ulcerative colitis of whatever origin should be subjected to a complete sig-

moidoscopic study and x-ray of the colon, because subjective symptoms of the two diseases are similar and only objective examinations may show the true nature of the trouble.

One is more likely to fall into error when there has been a positive bacteriologic examination or previous history of amebiasis and when the examiner is not alert and carcinoma-conscious. This, in our opinion, accounts for the paucity of recorded cases—not their failure to occur together.

"A MEDICAL UNDERWORLD"

"The ghostwriter is with us today in medicine as elsewhere. One cannot always be completely certain that one is not reading or listening to a ghostwritten paper or address," says a contributor to the *Bulletin* of the Medical Society of the County of Kings, and he continues: "Ghostwriting is a secret activity—which aligns it ethically, by the way, with feigning, there is an element of deception in both—in one case the patient is deceived, in the other the reader."

"While not a factor in the origin of medical ghostwriting, it can hardly be denied that our leading medical journal, which insists that its articles follow a rather stereotyped form, has simplified and facilitated the work of the ghostwriting sweatshops. Under such relatively rigid specifications it could be argued that articles might just as well be ghostwritten. They bore the reader and he peruses only the summaries and conclusions."

"We do not believe that were it not for the ghostwriter 'the machinery of everyday life and the foundations of civilization would wobble,' as has been argued. It seems to us that getting rid of our windbags, exhibitionists, and incompetents, the employers of ghosts, would be

wholesome and helpful. We believe that the social system could stand the transition. For the roots of the evil are not yet very deep."

"To a degree, the ghosts have become our 'artificers of ready-made and custom-made sentiments—skilled taxidermists of lifelike statements—the carvers of figureheads—the ventriloquists of patriotism, eloquence, high ideals and mock emotions.' And remember that the strictly medical ghostwriter is among the most highly talented. He, or she, can be a breath-taking artist. We have seen the work of these marvelous proxies, not yet so numerous in medicine, thank heaven, as in other fields."

"Ghostwriting is a disquieting thing. If it were to flourish much more than at present it would bring about a lack of full confidence in the creative genius or even everyday working capacity of the profession. In such shabby circumstances it would make one recall the hollow social shell that was France before the débâcle."

"It is our conviction that the great majority of our active men have no reason at all to depend in any degree upon 'the underworld of creative expression.'"

"Note and guaranty. This editorial not ghostwritten, words by A. C. J."

GALLBLADDER DISEASE

A Consideration of Mortality

CHAS GORDON HEYD, M D , F A C S , D M Sc , New York City

GALLBLADDER disease is probably the most common intra-abdominal condition and manifests itself in a variety of ways. It is almost uniformly associated with symptoms which vary in degree, in disability, in danger and in the production of distant or remote sequelae. It is the general opinion that the gallbladder functions as a reservoir after the concentration of bile and as the control of the ebb and flow of bile into the intestinal tract. Infection of some type is basically the etiological factor in the production of pathological changes in the gallbladder, extra biliary system, the liver, pancreas, and more remote organs. No age or sex or constitutional status, is immune from gallbladder affections nor wholly protected from its effects.

The main symptoms of gallbladder disease are primarily local and confined to the gastrointestinal system. There are, however, certain allergic states that are due to a low grade, continuous infection of the gallbladder. There are, in addition, undoubted cases of remote effects in the production of various types of arthritis. Again, there is a systemic effect of gallbladder disease as manifested in continuous ill-health, called "cholecystic toxemia." Furthermore, even a moderate experience in gallbladder symptomatology will discover not a few cases of cardiac disturbance that are basically the result of gallbladder disease. The latter statement is not intended to include the mistake or error in diagnosis that is occasionally made in considering a case of coronary thrombosis an acute gallbladder manifestation or as more frequently obtains, an atypical gallbladder attack simulating the syndrome of coronary disease.

From January, 1920, to June, 1937, 5,000 consecutive cases of gallbladder disease were analyzed by Drs HEYD, CARTER, and HOLT. Of these 3,986 were operated upon by 53 different surgeons, 50% of the number of the operated cases were private and 50% were so-called clinic patients. In these

3,986 operated cases there were 309 deaths from any cause whatsoever, giving a basic hospital gallbladder mortality of 7.7% (Table I). This general figure of 7 to 8%

TABLE I—ANALYSIS OF 3 986 CONSECUTIVE OPERATIONS ON THE BILIARY TRACT (1920-1937)

Operation	Total Number	Mortality (No)	Mortality (Per Cent)
Chronic Cholecystitis			
Cholecystectomy	3 240	190	5.8
Alone or with appendectomy	2 438	88	3.61

Total for all biliary tract operations	3,986	309	7.7

mortality is in general accord with other reports covering a like period of time and approaching it in numbers. In the "break up" of this operative material a number of significant facts emerged. The clinical and mortuary impact of these statistics is arresting and resulted in some significant deductions in regard to diagnosis, pre-operative treatment, operative technique, postoperative treatment and the eventual curability and morbidity of the surviving patients.

Seriatim, we may consider a few of the most outstanding features of the study.

1 THE CONTINUOUS AND PROGRESSIVE CHARACTER OF ALL INFECTIONS OF THE GALLBLADDER. It became apparent that disease of the gallbladder does not spontaneously

Presented at the Seventeenth Annual Meeting of the Association of Surgeons of the New York Central System Hotel Baltimore New York City Wednesday, September 25, 1940

Reprinted from *Industrial Medicine* 10 No 5 183-186 (May) 1941

Professor of Surgery, New York Post-Graduate Medical School Columbia University

"cure" itself but from the very nature of the disease is a continuous, pathological process with a high degree of cyclic periodicity in symptoms. This inherently progressive course of gallbladder disease involves in chronological order the gallbladder, cystic duct, the common duct, the liver, the pancreas, and finally affects the entire organism. This pattern of continuous and progressive change varied, to be sure, but in the main the evolution of symptoms was dependent upon chronicity, the constitutional habitus of the individual and the inherent degree of infectivity, plus the mechanical factor of obstruction in the ducts from either inflammation or calculous formation. With chronicity, the number and severity of the symptoms increased, the technical difficulties of surgical intervention became greater, and the mortality rate invariably rose. For example, there were 1,270 operations on patients with symptoms of chronic cholecystitis of less than two years' duration. Nine hundred and fifty-nine of these operations were uncomplicated, with 13 deaths, or a mortality of 1.38%. However, in the same group there were 311 patients with complications, individuals who had a history of a previous acute attack, or the gallbladder surgery was complicated by some additional surgical procedure. Twenty-two of these patients died, giving a mortality of 7.10% (Table II).

TABLE II—AN ANALYSIS OF THE RESULTS OF OPERATION IN CHRONIC CHOLECYSTITIS WHEN DEFINITE SYMPTOMS HAVE BEEN PRESENT LESS THAN TWO YEARS

	No	Deaths	Per Cent Mortality
Uncomplicated cases	959	13	1.35
Complicated*	311	22	7.10
Total operations	1,270	35	2.75

Causes of Death		Major Complications	
Pneumonia	11	Wound infections (severe)	23
Peritonitis	10	Dehiscence	15
Liver death	4	Pneumonia	8
Cardiac failure	4	Thrombophlebitis	5
Operative shock	3	Postoperative hemorrhage	4
Postoperative hemorrhage	2	Pleurisy (effusion)	3
Uremia	1	Cardiac failure	3
		Surgical erysipelas	1
		Peritonitis	1
		Acute parotitis	1

* Those with previous acute attacks or with secondary operations

It is a generally held opinion that stones in the common duct are sequential to calculi in the gallbladder. Stones in the common duct were found in 6% without any calculi being present in the gallbladder. It is, however, easy to conceive that an infection of the

gallbladder may, by reason of mucosal conditions, not produce gallstones within the gallbladder, but by constant bathing of the common duct with infectious material produce "de novo" calculi in the common duct.

Cholecholestomy was performed simultaneously with cholecystectomy or cholecystostomy for chronic gallbladder disease in 260 patients, and calculi in the common duct were found in 82% of these patients, and in 3,306 operations for chronic cholecystitis the common duct was explored in 77%. According to the report of the pathologist associated "pathological changes in the common duct were almost invariably associated with severe pathological changes in the gallbladder." The statement validates the assumption that common duct disease is usually secondary to gallbladder disease. Symptoms of gallbladder disease in patients with common duct calculi provide a rather interesting observation as to the duration of symptoms and mortality. There were 1,270 patients with symptoms of gallbladder disease of less than two years. Twenty-four had stones in the common duct, representing a percentage of common duct stones of 1.9. In other words, in any group of individuals with gallbladder symptoms of approximately two years' duration at least, 2% will have common duct stones. There were 1,020 patients with symptoms of gallbladder disease from two to 10 years. Ninety-two had common duct stones and the percentage of common duct stones rose to nine. In 610 patients with gallbladder symptoms of from 10 to 35 years, 97 had common duct stones and the percentage of common duct stones rose to 16 (Table III).

TABLE III—DURATION OF CHOLECYSTITIS SYMPTOMS IN COMMON DUCT STONE
Duration of Symptoms

	Total Cases	Common Duct No Cases	Per Cent Common Duct Stone
Under 2 years	1,270	24	1.9
2-10 years	1,020	92	9.0
10-35 years	610	97	16.0

It is interesting that in 574 operations for acute cholecystitis—the diagnosis of acute cholecystitis was entertained only when made by the pathologist—80 patients had common duct stones, an incidence of approximately 14%, and in only three of these patients was there lacking a history of previous gallbladder symptoms. In other words, in the acute gall-

bladder cases approximately 96% had a definite history of chronic gallbladder disease and 80% of all the secondary gallbladder operations followed a cholecystectomy

2 **MULTIPLE SURGERY** About 13% of the operations in women with gallbladder disease were associated with fibroids and nearly 10% of all the series, both male and female, had gastro-duodenal ulceration

It is a rule at the Post-Graduate Hospital to remove the appendix in practically all intra-abdominal operations. The mortality of operations on the gallbladder, with or without appendectomy, showed practically no variation between the two groups. However, when other operations were added to cholecystectomy, the mortality increased rapidly with each type of secondary operation. If there were added to any gallbladder surgery a gastro-enterostomy the mortality became 16 4%, with gastric resection, the mortality rose to 31 1, and with hysterectomy a mortality of 11 8% was obtained. It is obvious that surgical intervention for gallbladder disease is an operative intervention of sufficient magnitude to be the sole and only indication for the surgical intervention (Table IV)

Earlier, I referred to the fact that in this large series 7 7% of the patients had the common duct explored and that stones were

found in 82% of the cases, with a mortality of 11 34. I also stated that four-fifths of secondary operations on the common duct were in patients who had had a cholecystectomy. Choledochostomy following a previous cholecystectomy was done in this series in 39 instances, with a mortality of 40%. Only six of these 39 patients had their original operation at the Post-Graduate Hospital. 33 were done in other hospitals. Of the 39 patients who had common duct operations following a previous cholecystectomy 32 of the group, or 80%, had recurrent overlooked stones. The inference is obvious, that any operation for gallbladder disease should, if and when there is evidence of common duct disease, be completed by exploration of the common duct as part of a single operative procedure.

Considerable controversial gallbladder literature has arisen in the discussion of acute cholecystitis. Like most discussions more heat has been generated than light. We are not inclined to believe that there is any such "immediacy" for surgical intervention in acute gallbladder disease as applies to gastrointestinal perforations or acute appendicitis. In other words, the term "immediate operation" as opposed to "deferred operation" is a misnomer. Acute cholecystitis—the diagnosis being made only by the pathologist—occurred in 14 5% of the series, whereas the incidence of stones in the gallbladder in chronic cholecystitis was approximately 70%, 89% of the acute cases had calculi in the gallbladder. Undoubtedly the mechanical factor of calculus is a factor of marked importance in initiating the acute phases of cholecystitis. It has been found that the individual with an acute gallbladder who had a hospital residence of from six to 24 hours before operation produced as a group the least mortality in this condition. One hundred and twenty-eight patients were operated within six hours after their admission into the hospital, with a mortality of 16 6%, and this is almost exactly the same mortality of 80 patients whose disease began within 48 hours of their operation, namely 15 10%. Two hundred and ninety-seven patients were prepared pre-operatively from 6 to 24 hours, with a mortality of 7 4%, or within the basic mortality of the entire group 7 7. One hundred and forty-nine other patients were prepared from two days to 24 days, with a mortality of about 13%. Of 316 cases observed 16 hours or longer 57% had a continuous progression of their symptoms and physical findings. In only 12% was there definitely a subsidence of the clinical picture.

TABLE IV — CHRONIC CHOLECYSTITIS
Factors Influencing the Morbidity and Mortality in Surgery for Chronic Cholecystitis

Factors	No of Cases	Morbidity	Per Cent Mortality
(A) Multiple surgery (Cholecystectomy plus secondary operation)	575	1 72	13 85
1 With gastroenterostomy	128		16 4
2 With pyloroplasty	111		9 9
3 With gastric resection	61		31 1
4 With acute appendix	31		13 0
5 With hysterectomy	59		11 8
(B) Conservative treatment in acute cholecystitis			
1 Subdud acute	474	1 59	11 02
2 With chronic abscess or old perforation into colon	46	2 20	38 0
3 Cholecystostomy in previous acute	15	1 58	20 0
(C) Cholecystostomy in chronic	63	1 50	7 4
(D) Jaundice (especially necessitating common duct surgery)	254		13 0
(E) Delay in surgery for chronic cholecystic symptoms. Series with less than two years history	959		1 35
Total series of chronic cholecystitis	3,303	1 31	8 4

*Means cholecystostomy for a previous chronic infection—now followed by a cholecystectomy

Jaundice is rightly believed to indicate chronicity of disease of the 574 acute cases a definite history of jaundice was present in 101, with a 15 8% mortality and jaundice was present at the time of operation in 155 patients, with a 20% mortality In other words, the history of jaundice increases the mortality expectation over 100% and jaundice at the time of operation increases the mortality expectation 200% (Table V)

TABLE V—ACUTE CHOLECYSTITIS
Factors Influencing the Mortality and the Morbidity in Surgery in Acute Cholecystitis

B Degree of Pathology (Attending Pathologist's Diagnosis)		
Factors	No of Cases	Mortality
(1) Acute cholecystitis	206	5 85%
(2) Purulent cholecystitis	117	9 40%
(3) Gangrenous cholecystitis	150	7 33%
(4) Perforated, with abscess	10	0 00
(5) Perforated with peritonitis*	51	35 85%
B Complicated Cholecystitis (Comparison with Acute Only)		
(1) Acute only	206	5 85%
(2) Complicated cholecystitis	368	14 10%
(3) Perforated cholecystitis (known)	69	26 10%
C Duration of Present Illness		
(1) Operated within 48 hours of onset	81	11 10%
(2) Between 48-96 hours (2-4 days)	137	5 90%
(3) Between 4-7 days	104	7 70%
(4) Between 7-50 days	182	16 71%
D Duration of the Period of Hospital Observation Pre-Operative		
(1) 0-6 hours	128	15 62%
(2) 6-24 hours	297	7 41%
(3) 24-48 hours	58	10 35%
(4) 2-24 days	91	17 59%
E Jaundice		
(1) Definite history of jaundice (past)	101	15 80%
(2) Jaundice at time of surgery	155	20 60%

* Exclusive of 16 cases with clinical peritonitis where cholecystostomy was done

Finally, the cyclic character of gallbladder disease is indicated in a consideration of Table VI The pathologist divided his material

TABLE VI—THE CYCLE OF ACUTE GALLBLADDER DISEASE
(As seen in 574 pathologically acute gallbladders)

Clinical Course Pathological Equivalent	Single Acute Attack—No Definite History of Previous Cholecystitis			
	Acute	Purulent	Gangrenous	Perforated
No of cases in each group	51	25	42	23
Mortality per cent	3 9%	4 0%	4 8%	26%
Clinical Course Equivalent Pathological	History of One or More Acute Attacks or a History of Chronic Cholecystitis			
	Chronic or Acute	Purulent	Gangrenous	Perforated
No of cases in each group	155	92	108	46
Mortality per cent	6 4%	10 7%	8 3%	33 7%

from the 574 cases of so-called acute cholecystitis into acute, purulent, gangrenous, or perforated The mortality in the first three of these categories, "following a single acute attack, with no definite history of a previous cholecystitis," is well within the mortality rates of simple, uncomplicated cholecystectomy, namely 3 to 5% However, in 401 cases of acute cholecystitis (in 34 similar cases no pathological tissue was obtained) with a history of one or more acute attacks or a definite history of previous chronic cholecystitis, the operative mortality was approximated double in each of the categories—acute, purulent, and gangrenous cholecystitis

MOTHERHOOD MADE SAFER

More important than the elimination of much of the pain and discomfort formerly associated with pregnancy is the removal of many of the hazards of the event as a result of increased knowledge of infection and its control, of the physical changes that take place in the human body, and of medicine generally, *Hygeia, The Health Magazine*, says in the May issue "The chief causes of death in childbirth and pregnancy are first, infections, second, the intoxication which is called toxemia of pregnancy, third, hemorrhage and shock," the editorial continues "The intensive research now being carried on in various parts of the country to control these specific factors should yield great dividends in lives saved in the years to come" *Hygeia* points out that fundamental in lowering still further the possibility of death in childbirth is education Dr Nicholson J Eastman of Johns Hopkins University has listed symptoms which give warning of hazards during the period before birth. These symptoms, which require immediate report to the physician, are (1) bleeding of the organs involved in childbirth,

(2) swelling of the face or fingers, (3) severe continuous headache, (4) dullness or blurring of vision, (5) pain in the abdomen, (6) persistent vomiting, (7) chills and fever, and (8) sudden escape of the fluid in which the child is carried. "Whenever any of these signs or symptoms occur the physician should be called immediately," the editorial warns "Unquestionably, this in itself would save many a mother and many a child." The desirability of having births take place in hospitals rather than in homes is emphasized "There are many who still believe that it is safer for the baby to be born at home," the editorial declares "Under proper conditions, this is undoubtedly true However, the possibility of securing such proper conditions in the home is slight compared with the possibility of securing suitable conditions in the hospital "However, the fact that there were just slightly over 9,000 maternal deaths in more than 1,250,000 live births is an indication of the tremendous advance made by scientific medicine in this field "

Case Report

TYPHOID CARRIER WITH BACILLUS TYPHOSUS BACTEREMIA ACCOMPANYING AN ACUTE EXACERBATION OF A CHRONIC CHOLECYSTITIS

EMIL VERRILLI, M D , Mamaroneck, New York, and EDWARD A. LANE, M D , White Plains, New York

THE accidental discovery of a chronic typhoid carrier with a *Bacillus typhosus* bacteremia accompanying an acute exacerbation of a chronic cholecystitis appears to be of sufficient rarity and interest to warrant reporting. A perusal of the *Quarterly Cumulative Index Medicus* under the headings of "typhoid carrier" and "cholecystitis" for the past ten years failed to disclose any references to the associated conditions in question.

Case Report

The patient, a white man, aged 55, was taken acutely ill (April 1, 1940) with what was at first thought to be pneumonia. There were chills and fever (103.6 F) and pain in the upper right side of the abdomen which might have been referred from the pulmonary region, accompanied by acceleration of the pulse (124) and respiration (32). The lungs showed questionable dullness at the right base, with many moist, crepitant rales over this area but no change in voice or breath sounds. The abdomen was soft and obese with slight tenderness under the right costal arch. The liver and spleen were not enlarged and no masses were felt. Both hands and feet were deformed from arthritis deformans. Blood count (April 3) showed 20,000 white blood cells with 90 per cent polymorphonuclear cells.

In the absence of a productive cough and sputum, a blood specimen was examined (April 6) for possible isolation and typing of pneumococci. An organism was isolated that proved to be *B. typhosus*. Meanwhile the temperature that had subsided after six days of fever, ranging from 101 to 105 F, flared up again on two occasions during the ensuing two weeks (April 17 and 21).

The history relevant to the current illness disclosed the fact the patient had had typhoid fever thirty-six years previously while attending college in New England. A high-grade hearing defect dates from that illness. Twice since then he has suffered from attacks similar to, but not as severe as, the recent one. The first occurred twenty-four years ago and the second, eight years ago. On both of these occasions, contrary to the recent attack, he became jaundiced. He has suffered from arthritis for the past twenty-six years and has had diabetes for at least two years.

In view of the evident diagnosis of a cholecystitis of typhoid origin, a series of five stool specimens (taken April 14, 19, 21, 26, and May 1) were examined, and all were found to contain *B. typhosus*. Cholecystectomy was advised as soon as the patient's condition warranted it, both to relieve him of the chronic cholecystitis and, if possible, to free him of his typhoid carrier condition. Following a period of normal temperature

during which the blood count fell to 8,000 white blood cells with 67 per cent polymorphonuclears, the blood gave a sterile culture and the urine was rendered sugar-free, the patient's gallbladder was removed on May 3.

At operation (performed by Dr. J. V. Hibbard), an advanced, suppurative, inflammatory condition was found involving the gallbladder, under surface of the liver, and adjacent omentum. The gallbladder contained one large, greenish black stone measuring 75 by 25 by 25 mm (Fig. 1). The region of the common duct, hepatic artery, and portal vein was occupied by a mass of induration in which the common duct could not be identified. The gallbladder and stone were removed, and the abdominal wound was closed with drainage.

Following operation, laboratory examinations showed the presence of *B. typhosus* in the gallbladder, in a culture from the drainage taken eleven days after operation, and in repeated stool specimens, the most recent of which was taken almost two months after operation. It is evident, therefore, that removal of the gallbladder has not eliminated the carrier condition in this case.

Dr. Margaret Loder, pathologist at the United Hospital, Port Chester, where the operation was performed, reported that the gallstone removed from this patient is the largest that has been obtained thus far at that hospital.

Summary

A patient with an acute exacerbation of a chronic cholecystitis was discovered to have a *B. typhosus* bacteremia.

He has evidently been a typhoid carrier for the past thirty-six years, during which time he has not infected any family contacts or anyone outside the family as far as is known.

Removal of the gallbladder has failed to cure the typhoid carrier condition.

A gallstone of unusual size was removed with the gallbladder.

FIG 1 Full stone, size 75 by 25 by 25 mm

Therapeutics

CONFERENCES ON THERAPY

THESE are stenographic reports, slightly edited, of conferences by the members of the Departments of Pharmacology and of Medicine of Cornell University Medical College and the New York Hospital, with collaboration of other departments and institutions. The questions and discussions involve participation by members of the staff of the college and hospital, students, and visitors. The next report will appear in the July 1 issue and will concern "The Use of Vitamin B Fractions."

The Uses of Adrenal Cortical Hormones

DR EUGENE F DuBOIS Two years ago Dr Robert F Loeb of the College of Physicians and Surgeons spoke to us about Addison's disease and its treatment. We are fortunate that today he is to continue on the subject of the uses of adrenal cortical hormones.

DR ROBERT F LOEB I told Dr DuBois that in my opinion adrenal cortical hormones are used in three categories of patients: first, those with demonstrable adrenal insufficiency, second, those with equivocal adrenal insufficiency, and third, those without adrenal insufficiency. Now I should venture to guess that infinitely more is used in patients without adrenal insufficiency than in patients with adrenal insufficiency. I also told Dr DuBois that I feel only moderately secure in talking about adrenal hormone therapy in demonstrable cortical insufficiency. I also feel insecure in talking about adrenal hormones in the treatment of equivocal adrenal insufficiency, and I find it requires faith to talk about the value of hormones when adrenal insufficiency in all probability is not present.

I should like, if you will bear with me, to start out by reviewing briefly some of the disturbances known to be present in demonstrable adrenal insufficiency. These fall, without question, into two categories and possibly into a third. The first group of disturbances which is unequivocal and which is readily demonstrable in adrenalectomized animals and in patients with adrenal insufficiency, that is, Addison's disease, is the group of disturbances associated with abnormalities in the behavior of electrolytes and water. As you know, there is a definite increased excretion of sodium in adrenal insufficiency. With this there is also loss of water, which is reflected in the plasma volume and to some extent in the interstitial compartment. There is also associated, although less regularly, an increase in the potassium

concentration in the serum and, perhaps, increased potassium concentration in the tissues themselves. There is also a series of disturbances of renal function as characterized by nitrogen retention in advanced insufficiency in man and in earlier insufficiency in animals. Associated with this is a decrease in urea clearance and also a decrease in the ammonia excretion by the kidney. How many of these changes in renal function can be attributed to decreased plasma volume and to decreased blood flow we do not know. However, these are certainly factors of prime importance. Whether there are specific changes in the renal tubule cells which are also responsible for these changes in renal function, as there probably are in relation to sodium and potassium disturbances, we do not know. This all is included in one category of disturbances, and I think that this category of disturbances is, in part anyway, also responsible for hypotension, which is another characteristic of adrenal insufficiency. Whether any other factors have to do with hypotension in adrenal insufficiency we do not know. I have a feeling there may be, and I will come to that in a moment.

The second category of demonstrable physiologic disturbances in adrenal insufficiency includes those related to carbohydrate metabolism.

In 1909 Porges first demonstrated hypoglycemia in patients with adrenal disease. At that time the hypoglycemia was thought to be due to disturbances in the adrenal medulla. More recently, Britton and Sylvette fought a battle against all comers when they suggested that the adrenal cortex was important in controlling the carbohydrate metabolism. Finally, they have been completely substantiated in their contention by the studies of Long and his co-workers, by the studies of Kendall and others at the Mayo Clinic, and by Thorn and his associates in Baltimore. We know that a fair percentage of patients with

FIG 1

demonstrable adrenal insufficiency undergo severe hypoglycemic shock, spontaneously, I might add. Furthermore, we know that patients with demonstrable adrenal insufficiency have focal and diffuse neurologic signs which at times, at least in part, may be ascribed to hypoglycemia and which, perhaps, may also in part be ascribed to decreased cerebral blood flow. Whether a third factor enters into the neurologic manifestations we do not know. We know that patients with Addison's disease are unusually sensitive to insulin injection, which again suggests a disturbance in carbohydrate metabolism. In animals the changes in carbohydrate metabo-

lism are readily demonstrated. We know from the work of Kendall that the administration of certain adrenal hormones increases the excretion of sugar, not only in phlorhizimized animals but in partially pancreatectomized animals. The same hormones increase nitrogen excretion, indicating that they increase gluconeogenesis. They also increase glycogen storage in the liver of normal rats and mice as shown by Long. So you see we have considerable evidence of a significant part played by the adrenal cortical hormones in carbohydrate metabolism, particularly as seen in the lower animals. Whether or not these are all secondary to decreased protein

FIG 2 Modified from Kendall

breakdown in adrenal insufficiency, as suggested by Long, we do not know

We also know from the work of Ingle that certain cortical hormones, those that are effective in influencing carbohydrate metabolism, have a definite effect on the work capacity of adrenalectomized rats. On the other hand, we know that the hormone that affects the salt and water metabolism has relatively little effect on the work capacity of adrenalectomized animals, although this one hormone has a striking life-maintenance activity

There are, then, two definite groups of disturbances demonstrable in adrenal insufficiency. There is possibly a third type of disturbance, and I should like now to discuss this briefly on the basis of human observations (Fig 1)

A certain number of patients with Addison's disease, of which this record is representative, die what I believe to be an Addisonian death, characterized by a falling blood pressure, by a soft pulse, and by profound asthenia. These changes are not related to the state of the electrolyte and water metabolism

EFFECT OF TEN DAYS TREATMENT WITH DESOXYCORTICOSTERONE PROPIONATE

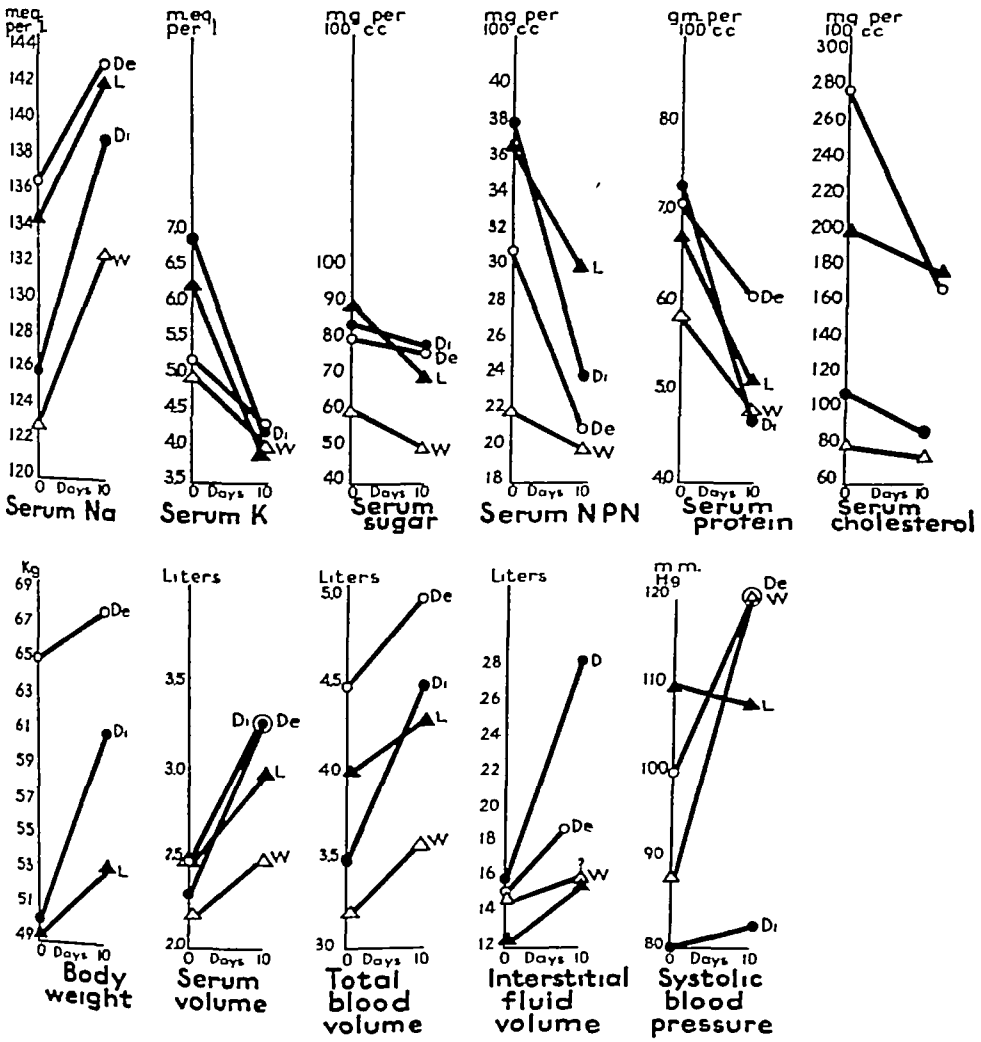

FIG 3

and are apparently unrelated to the level of the blood sugar. Furthermore, these patients at times fail to respond to what may be considered adequate therapy with active hormonal substances as gaged by the effects on the water content of the blood, the electrolyte content of the blood, and, as I have said, the maintenance of blood sugar. These patients, then, die Addisonian deaths, usually associated with a terminal rise in fever and with a sharp decrease in blood pressure but without the chemical changes mentioned. Whether these

patients suffer from a disturbance of their peripheral blood vessels on a local basis or whether they suffer from a central disturbance of their vasomotor apparatus I do not know, but that they do suffer from a disturbance of the vasomotor apparatus seems fairly certain. I think that it is important to bear this in mind, because, if we close our eyes to possibilities other than the effects on water and salt and carbohydrate metabolism, we may miss an important aspect of adrenal insufficiency. I have talked thus far about the disturb-

ances that are present in demonstrable insufficiency. We should like to know what we can anticipate in the treatment of demonstrable human adrenal insufficiency with adrenal hormone. That brings us to the first question—namely, what hormones have we available?

Isolated from the adrenal cortex are approximately twenty steroids, four of which have a great similarity with the exception of one or two oxygen atoms. The nature of the activity of these different steroids is dependent on whether or not these extra oxygen atoms are present and where they are in the molecule. There has been isolated from the adrenal cortex, as you may note in Fig 2, one of the steroids, desoxycorticosterone, which is strikingly effective in relation to salt and water metabolism. This has not only been isolated but has been synthesized by Reichstein and is available commercially. Desoxycorticosterone in man, and probably in ani-

mals, has either no, or minimal, effects on the carbohydrate metabolism. Some of the other steroids which have been isolated from the cortex are corticosterone, dehydrocorticosterone, and what is known as compound "E" of Kendall. These have been isolated in small amounts, are not available for commercial use, and to my knowledge have not yet been synthesized. These substances have relatively little effect on salt and water metabolism but have definite effects on carbohydrate metabolism, the one having the greatest effect being this compound "E" of Kendall, which is 11-dehydro-17-hydroxycorticosterone. We have available for treatment only one steroid and that is desoxycorticosterone, which, as I have stated, has purely salt and water activity.

Most patients with Addison's disease require desoxycorticosterone, but we have 3 or 4 who cannot be persuaded to take desoxycorticosterone because they are perfectly comfortable with the oral administration of

sodium chloride alone. The desoxycorticosterone can be given either parenterally by injection or in pellet form. Most patients who are not suffering from active tuberculosis return to some type of work or gainful occupation. I think that this hormone marks a great advance in the treatment of Addison's disease—that is, demonstrable adrenal insufficiency.

Fig 3 merely summarizes in a series of patients with Addison's disease what can be accomplished with desoxycorticosterone. You will note that the blood sodium increases and the potassium decreases, the nonprotein nitrogen decreases, the serum protein decreases, and the body weight increases. The blood volume, the plasma volume, the interstitial fluid volume also increase and, in time, the blood pressure, although the blood pressure rises are relatively late.

One should bear in mind that toxic reactions result from excessive doses of desoxycorticosterone in Addisonian patients.

I may say a few words about the effects of other hormone preparations in man. Fig 4 compares the effects of desoxycorticosterone with other preparations in a patient with Addison's disease. This patient was maintained in good condition on a standard regimen with a daily dose of 6 mg of desoxycorticosterone throughout the period of study. The levels of excretion of sodium, potassium, and nitrogen in the control period are apparent. You will note that when we added 20 mg of desoxycorticosterone daily over the usual ration there was a striking decrease in sodium excretion with a definite increase in potassium excretion. In the same study during one period of observation of five days, the effects of an average daily dose of 18 mg of corticosterone* were noted in contrast to 25 mg of desoxycorticosterone. It is apparent from this record that the effect on sodium excretion, which was marked with desoxycorticosterone, was insignificant in the case of corticosterone. Perhaps there was a slight increase in potassium excretion. Then we compared the effect of desoxycorticosterone with a potent cortical extract. In addition to the maintenance dose of desoxycorticosterone, 25 cc of this cortical extract was given daily over a period of five days. Again, one may see the difference in effect between the desoxycorticosterone and the cortical extract on the excretion of sodium. There is virtually no decrease in sodium ex-

FIG 5

cretion and little, if any, increase in potassium excretion with 25 cc of the cortical extract a day. Corticosterone, which is known to be active in its effects on carbohydrate metabolism in animals, has virtually no effect on the salt and water metabolism in the controlled Addisonian patient, and 25 cc of the cortical extract likewise has a minimal effect on the electrolytes and water. Desoxycorticosterone, the one pure hormone that is available for patients, has, on the other hand, a striking effect on salt and water metabolism.

In this study we also observed the effect of desoxycorticosterone, of corticosterone, and of cortical extract on blood sugar curves. These curves are fairly comparable because the patient ate identical meals over a period of many weeks. In the record of Fig 5 I think you will see that at the end of three hours the blood sugar fell to approximately 50 mg per hundred cubic centimeters, regardless of whether he had had cortical extract, corticosterone, which is supposedly carbohydrate active, or desoxycorticosterone in large doses for five days before the glucose tolerance test. In the first part of the curve there is perhaps some increase in the blood sugar level after the administration of corticosterone and cortical extract. That would be negligible certainly were it not in accord with what is observed in animals, although I think it is safe to say that the effect on carbohydrates obtained by 25 cc of cortical extract a day, or by 18 mg of corticosterone a day, is not worth anything from a practical standpoint in preventing hypoglycemia or in elevating the blood sugar. Thorn has made similar studies comparing the effects of corticosterone and Kendall's compound "E" with desoxycorticosterone. Thorn gave 85 mg of corticosterone in one dose and obtained a definite effect, more striking than ours. He also ob-

* Corticosterone, desoxycorticosterone, and cortical extract were obtained from the Roche-Organon Laboratories.

tained an effect on the respiratory quotient which we failed to obtain with either corticosterone or cortical extract in the dosage we used. Compound "E" of Kendall showed still more striking effects on the carbohydrate metabolism in Thorn's experiment with a dose of 30 mg.

As I have said, these two steroids are not available commercially. The amounts necessary to produce any effects in man are enormous. So I think we can say with relative certainty that the clinical effects of the cortical hormones, other than desoxycorticosterone, are minimal and, even with as much as 25 cc of cortical extracts daily, the effect on the salt and water metabolism is small. So much for what can be accomplished with the various hormones in the treatment of demonstrable adrenal insufficiency.

I should like now to turn briefly to our second category of patients—namely, those with equivocal insufficiency. The literature today is full of recommendations for the use of cortical materials in the treatment of patients who feel tired, who have low blood pressures, who have poor appetites, who also have severe acute infections, and who may at times have low blood sugar curves—for instance, the patients with sprue. These symptoms are similar to those seen in adrenal insufficiency. How specific they are, however, I think is uncertain. My feeling is that they are non-specific, and to state that these symptoms are manifestations of adrenal insufficiency in these patients is unjustified.

There are two pieces of work which perhaps give some support to those who use the cortical hormone in treating tired women and men, too. One of these is Ingle's observation on the effect of work on the size of the adrenal glands. Ingle has shown that continued hard physical work on the part of a rat increases the size of the adrenal glands in the course of a few hours. Perhaps it is fair to assume that if the adrenal glands enlarge in the course of a few hours they do so because they have had increased work to do. The other piece of evidence is that of Weil and Browne, who have shown that patients subjected to physical stress, the stress of surgical anesthesia, or the stress of acute infections excrete, in their urine, substances that will protect young adrenalectomized rats from the devastating effects of cold. Studies show that adrenalectomized rats put in the icebox die quickly, and Weil and Browne have shown that the urine from people under stress, as I have said, contains substances that will protect these rats, as

does cortical hormone, from dying in the icebox and that urine from people without any demonstrable stress contains no such substances. They have not demonstrated that these protective substances are chemically related to the cortical hormones.

I have considerable doubt about the application of these observations. I personally dislike therapy not soundly supported.

In this same equivocal category of patients under stress comes the much-discussed problem of surgical shock. I believe that Dr Swingle was the first one to point out, or suggest, that cortical adrenal insufficiency was the cause of shock. His paper, which appeared in *Science* in January, 1933, called forth pretty serious criticism and I think, in part, on just grounds. I believe Dr Heuer and Dr Andrus here at Cornell were among the first to produce evidence suggesting that simultaneous injection of cortical extract and blood would prevent the shock resulting from the effects of toxic substances obtained from an obstructed loop of gut better than would transfusion alone. I do not know whether that work has been extended or what the attitude of the group here is toward that work at the present time.

Since then, many others have shown by one means or another that in shock there is apparently some beneficial effect, both in its prevention and perhaps in its treatment, from the use of cortical hormones of various types. Perla's work last year gave another impetus to the use of cortical hormones. We have recently tried to repeat some of the experiments, but we were unsuccessful. We discovered that inducing histamine shock in the rat, as Perla did, required more than $1\frac{1}{2}$ Gm of histamine per rat. A considerable variation in absorption might give misleading results with regard to protection. It was also not clear whether the slight apparent influence of the hormone might not be attributed to some further increase in salt and water retention as a result of desoxycorticosterone rather than to any more specific effect. Similar criticism can be applied to all, or almost all, the studies on shock and cortical hormone. It is my belief that it has not been convincingly demonstrated that cortical hormone has a specific effect or even, perhaps, any greater effect than would be obtained by a slightly larger injection of saline.

For the treatment of shock in man, Dr Scudder at the Presbyterian Hospital and others have emphasized the importance of cortical hormone with saline infusions, the

two being used together. Their results must be termed impressionistic. This is not said as a criticism beyond the fact that I desire to stress—namely, that I do not believe it has yet been proved that cortical hormone has any great advantage in the treatment of surgical shock.

Before closing I should like to say a word about the treatment of conditions that are, in all probability, not due to adrenal cortical insufficiency. You will find in the literature of recent months that cortical hormone is good for Paget's disease, myasthenia gravis, bromidism, and other disease states, and, if you will read those articles critically, you will find that the basis for the claims of success is questionable. Moehlig reported striking subjective benefit from desoxycorticosterone in a patient with myasthenia gravis. In 1 patient we attempted to confirm these observations. We have controlled electrolyte studies on the blood, and on two occasions we gave 5 mg of synthetic hormone daily for a period of five days, at which time the hormone was discontinued because of increase in symptoms to a point beyond which we did not dare proceed. The hormone given was sufficient on both occasions to induce a gain of more than 2 Kg in weight.

Recently, a most confusing paper by Bondurant and Campbell appeared in the *Journal of the American Medical Association* concerning the treatment of bromidism by means of 5 cc of cortical extract daily. The initial chloride levels in the blood were reported in different patients as varying from 198 to 693 mg per hundred cubic centimeters, a range indicating that errors in chemical technic must have been present. The chemical findings as reported are utterly incredible and the theoretic basis for treatment is wholly unsound. In addition to these criticisms it is most improbable that doses of 5 cc of commercial extract would have any significant influence on sodium or chloride excretion.

I point out these two instances merely to emphasize the fact that adrenal cortical hormone is being indiscriminately and uncritically employed in therapy.

DR DuBois. We are now ready for general discussion and questions.

DR C H WHEELER. I should like to ask Dr Loeb whether the use of adrenal cortical hormone or extract in instances of equivocal disease is associated with any risk.

DR LOEB. We know that adrenal cortical extract in relatively small doses and desoxycorticosterone in large doses cause adrenal

atrophy in animals. I do not believe the amounts of hormone administered even by the surgeons are enough to cause any damage to the adrenal glands. I think there is a risk with large doses of desoxycorticosterone, because there is no question but that one may obtain more than the desired retention of salt and water. To me it seems far simpler to give salt and water by vein to the point desired rather than to give desoxycorticosterone. Once this drug is in, it is much more difficult to control salt and water retention. As far as we know, desoxycorticosterone has effects only on salt and water disturbances.

DR HARRY GOLD. Some cases have been severely poisoned, and there have been cases of heart failure with edema caused by it, which I believe you reported, did you not?

DR LOEB. We have had Addisonian patients who have been definitely poisoned with desoxycorticosterone with extraordinary degrees of cardiac insufficiency with pulmonary congestion. Fortunately, it may be impossible to induce these effects in patients who have not had Addison's disease and who have normal hearts. We have not been able to produce cardiac dilatation in normal animals. We have produced diabetes insipidus and a striking periodic paralysis in dogs which is associated with an incredible replacement of potassium in the muscles by sodium, but I think that this is more of pharmacologic than of clinical significance.

STUDENT. Dr Loeb mentioned that there might be some other factor controlling blood pressure in patients besides potassium and sodium. Would he tell us more about that?

DR LOEB. I wish I could. As I have said, we see these patients whose blood pressures fall and Addisonian patients, with demonstrable adrenal insufficiency, who die in the state of peripheral circulatory collapse without the chemical characteristics of adrenal insufficiency.

STUDENT. Have you ever observed an unusually low potassium level in those patients?

DR LOEB. No, those patients have normal potassium levels. Our patients who have had too much desoxycorticosterone will have a low potassium level. I do not believe the low potassium level is the cause of cardiac insufficiency. In our normal dogs we have extremely low levels of potassium in the blood, but cardiac insufficiency does not occur there.

DR WHEELER. Have you ever observed, or has anyone else ever observed, the effect of these substances in familial periodic paralysis?

I wonder if you could induce an attack in them by excessive doses

DR LOEB We have only 2 patients who have real familial periodic paralysis. The blood potassium levels drop spontaneously at intervals, and, consequently, I do not believe it would be possible to tell what you are doing. I should be a little hesitant to use it in those patients because of the fact that they are cured by massive doses of potassium chloride, and I think it is possible that we would accentuate the disease to, perhaps, an unfortunate point if we gave them those substances.

DR McKEEN CATTELL In relation to the use of this material in shock, it seems to me fair to consider the problem with reference to secondary factors that are responsible in part for the development of the syndrome—that is, damage to the capillary walls. There is a certain amount of experimental evidence indicating that these hormones do decrease the permeability. I wonder what you think of that evidence.

DR LOEB Mencken has done some work that suggests that cortical extract decreases permeability. I wish someone would produce more convincing evidence that the hormones we are talking about have a specific capillary action. I have sought for that evidence for several years because of this group of patients. I showed you who die because of peripheral collapse without any salt and water disturbance. As I have said, those patients die despite the administration of as much as 110 cc of cortical hormone in twenty-four hours. Hormone seems to have little if any clinical effect in these cases.

DR GOLD Would I be correct in assuming that in the treatment of a case of Addison's disease you would not use cortical extract?

DR LOEB I think that that is a fair question. In the maintenance of patients I certainly would not use cortical extract. A dose of 25 cc a day may cause a minimal effect on the blood sugar but no effect on the salt and water metabolism comparable with desoxycorticosterone. I cannot see that anything is gained in the practical maintenance of the patients with adrenal insufficiency by means of the extract. Theoretically, cortical extract in huge amounts should be worth more than desoxycorticosterone for the simple reason that it contains at least minute amounts of some of the steroids other than the one that has purely a salt and water effect. From the practical standpoint, I cannot see that it makes much difference, although I will say

that we use both cortical extract and desoxycorticosterone in the treatment of crises. We try not to get too much desoxycorticosterone effect, and we control that by blood serum protein levels. When we think we have given enough to obtain effective dilution, we then give considerable quantities of cortical extract, hoping that we may secure an effect other than that on the salt and water metabolism. I cannot say that our hopes are particularly gratified.

DR WHEELER To what extent are these substances effective by the oral route?

DR LOEB I might report three experiences. First, we gave between five and fifteen dollars' worth of an oral cortical extract daily over a period of many weeks in conjunction with salt and could not tell whether the patient took it or not. That was experience number one. Second, we received a preparation that is put up with vitamin C. We gave this patient 15 of these tablets a day—the producer recommends 3 to 6—and lowered the patient's salt intake from 15 to 5 Gm a day while he was taking the 15 hormone tablets. In the course of three days the treatment precipitated a crisis. The third was a patient who had been advised to take the same preparation and had taken three dollars' worth every week. He came in with real insufficiency, which was alleviated by the administration of salt alone. On the basis of our experience I can say that oral cortical extract therapy has no place. There is no question but that activity can be demonstrated by oral doses in the animal, the ratio of doses by mouth and parenterally is something of the order of between 4 and 10 to 1. Recently, Anderson reported favorable results in treating Addisonian patients by the sublingual instillation of a few drops of desoxycorticosterone acetate dissolved in propylene glycol, one to three times a day. This procedure is distinctly promising, although we have had no experience with it.

DR CATTELL I assume that desoxycorticosterone is one of the materials in the chemical extracts of the cortex. Why then is the effectiveness of the extract so low?

DR LOEB It is a quantitative matter. Desoxycorticosterone is one of the steroids of the adrenal cortex present in the extracts. There are also other noncrystallizable steroids with an even higher effect on salt and water metabolism. The amounts of these potent substances in the usual cortical extracts are simply too small for effective results.

DR DuBois Is there any evidence that

these cortical preparations will be of help in relieving fatigue in the military services?

DR. LOEB Dr. DuBois, I wish I could answer that question—and I think it is a terribly important one to be answered. It seems to me that a proper study, with controlled conditions, would be very much in order to ascertain the answer. All I can say is that on the basis of present observations I know of no real evidence to suggest that the administration of cortical extract would in any way influence a man's effectiveness. However, it should be properly studied.

In conclusion, I should like to state that most of the observations reported from our studies have been carried out by a group working at the Presbyterian Hospital—Drs. J. W. Ferrebee, C. Ragan, D. Parker, and D. W. Atchley.

DR. CATTELL The material presented at this conference concerning the indication for the employment of the hormones of the adrenal cortex in therapeutics permits us to summarize with the simple statement: Only in demonstrable adrenal insufficiency do we have an unequivocal indication for the use of these hormones, and in this condition, as replacement therapy, dramatic therapeutic results may be attained. Doubt was expressed regarding the value of these hormones in states of weakness, low blood pressure, hypoglycemia, etc., where the evidence for adrenal deficiency is equivocal. Their use in peripheral circulatory failure falls into the same class. There is no justification for the employment of this therapy in Paget's disease, myasthenia gravis, bromidism, and other conditions where it has been uncritically recommended.

The disturbances resulting from adrenal insufficiency fall into two or possibly three classes. The first includes changes associated with the behavior of electrolytes and water, including increased excretion of sodium, loss of water which is reflected in a decreased plasma volume, an increase in plasma potassium, and a decreased urea clearance and ammonia excretion by the kidney. Possibly all these effects are secondary to altered kid-

ney function. The second group of disturbances includes those related to carbohydrate metabolism, the chief manifestation of which is hypoglycemia which may give rise to hypoglycemic shock and other nervous manifestations. The patient with adrenal insufficiency has a low sugar tolerance curve and may be unusually sensitive to insulin. The evidence for a third type of disturbance is seen in patients whose blood sugar, electrolyte, and water metabolism have been controlled by replacement therapy but who, nevertheless, die a characteristic Addisonian death, with a low blood pressure and terminal fever.

Approximately twenty steroids have been isolated from the adrenal cortex, but only one, desoxycorticosterone, is available for clinical use. Desoxycorticosterone is strikingly effective in correcting the disturbances in salt and water metabolism of adrenal insufficiency but has practically no effect on carbohydrate metabolism. On the other hand, certain other substances that have been isolated in small amounts and are not available commercially, including corticosterone, dehydrocorticosterone, and 11-hydro-17-hydroxycorticosterone, have been shown experimentally to have an effect in improving carbohydrate metabolism but to have little influence on the electrolyte and water balance.

In Addison's disease, desoxycorticosterone, given by daily injection or in pellet form, is effective in causing an increase in blood sodium and a decrease in blood protein, nonprotein nitrogen, and potassium. The blood volume and interstitial fluid volume increase and, in time, also the blood pressure. The patient gains weight and, in the absence of active tuberculosis, is restored to a normal life and occupation. Cortical extracts are not nearly so effective and are, in general, not recommended for maintenance therapy, even though theoretically they should afford more complete replacement. However, in the treatment of crises desoxycorticosterone may be supplemented with cortical extract in the hope of securing benefits in addition to those on water and salt metabolism.

PRACTICE-SAVER

A useful practice-protector for doctors called to duty with the Army or Navy has been suggested by a Philadelphia physician, says *Medical Economics*. A variation of an older idea sometimes used by doctors going on vacation trips, the scheme is described by its user as follows:

"During the last war I left my practice with a man I implicitly trusted and respected. After

I got to France, I made a point every few months of dropping a postcard to members of my practice. Often it was just a single line, a pleasantry, or a friendly query.

"But it let them know I was still alive, and reminded them that I hadn't slipped completely out of their world. The effort was later repaid many times over."

I wonder if you could induce an attack in them by excessive doses

DR LOEB We have only 2 patients who have real familial periodic paralysis. The blood potassium levels drop spontaneously at intervals, and, consequently, I do not believe it would be possible to tell what you are doing. I should be a little hesitant to use it in those patients because of the fact that they are cured by massive doses of potassium chloride, and I think it is possible that we would accentuate the disease to, perhaps, an unfortunate point if we gave them those substances.

DR McKEEN CATTELL In relation to the use of this material in shock, it seems to me fair to consider the problem with reference to secondary factors that are responsible in part for the development of the syndrome—that is, damage to the capillary walls. PRACTICE-SAVER

A useful practice-protector for doctors called to duty with the Army or Navy has been suggested by a Philadelphia physician, says *Medical Economics*. A variation of an older idea sometimes used by doctors going on vacation trips, the scheme is described by its user as follows:

"During the last war I left my practice with a man I implicitly trusted and respected. After

I got to France, I made a point every few months of dropping a postcard to members of my practice. Often it was just a single line, a pleasantry, or a friendly query.

"But it let them know I was still alive, and reminded them that I hadn't slipped completely out of their world. The effort was later repaid many times over."

Medical News

Albany County

Albany has the second lowest death rate among newborn babies of any city of comparable size in the state, figures of the maternal welfare committee of the county society show. Only 19 infants have died in the city during the past four years, compared with 13 in Binghamton. The rate for other larger cities in the state ranges into the hundreds. Albany's hospitals and the Visiting Nurse Association received praise.

Allegany County

Fifteen members of the county society were addressed on April 24 following dinner at Hotel Belmont, by Dr J Sutton Regan of the Buffalo General Hospital on the treatment of peritonitis following a ruptured appendix.

Cattaraugus County

The following items of special interest are contained in the annual report of the County Health Department.

The report states

"For the second year in our history no diphtheria occurred. No case of typhoid was reported, probably for the first time in over a century. No babies died of measles or of summer diarrhea. There were only 6 deaths from the ordinary communicable diseases, the same group that caused 49 deaths in 1920, just twenty years ago. Half of our preschool children are immunized against diphtheria. A sharp increase in pneumonia raised the deaths but little because of new methods of treatment.

"Fewer mothers were lost in childbirth. For the second time in recent years, the county rate was below the average in upstate New York. The use of obstetric consultants, begun the year before, increased in 1940. Two studies were begun with the help of the county society—one of infant deaths under a month, the other of the effect of sending a mother home a day or two after delivery."

Broome County

At the meeting held on May 13 in the auditorium of the City Hospital in Binghamton, Dr James E Perkins, director, Division of Communicable Diseases, New York State Department of Health, presented the analysis of the Binghamton pertussis study which was recently completed. He illustrated the talk with lantern slides.

Chautauqua County

Thirty-five members of the Jamestown Medical Society attended a dinner meeting at the Hotel Jamestown on April 24, with Dr D C Perkins presiding.

There was a discussion of the municipal laboratory library and Sidney Morris, brother of the late Dr Henry G Morris, presented a photograph of his brother for the library.

Dr W Gifford Hayward spoke on "Unusual Urological Cases" and Dr Otto E Koenigsfeld discussed the Balkan situation.

Erie County

The last stated meeting of the county society until October was held on May 27 at the Hotel Statler.

The annual and fourth stated meeting of the Buffalo Academy of Medicine was held at the Buffalo Museum of Science, April 23, Dr Francis D Leopold presiding.

The following nominees were elected to office for 1941 to 1942 with the exception of the secretary who is elected to serve two years, and the trustee for three years: president, Dr George E Slotkin, secretary, Dr A Wilmot Jacobsen, assistant secretary, Dr Clyde L Randall, treasurer, Dr William F Jacobs, and trustee, Dr Frederick T Schnatz.

On April 17 the first regular meeting of the newly formed "Medical Research Club of Buffalo" was held at the Medical School.

The founders and present officers of the Club are: Dr A Wilmot Jacobsen, president, Dr Niels C Klendshoj, vice-president, and Dr Stuart L Vaughan, secretary-treasurer.

The Charter Membership consists of 76 persons, each of whom has recently published results of meritorious clinical investigation.

Greene County

Dr Frederick L Patry, of Albany, who has served as neuropsychiatrist of the Albany Induction Board since its opening November 25, 1940, addressed the county society at Catskill on May 13. His subject was "Psychiatric and Neurological Examination Facts and Deductions After Processing 10,000 Selectees."

Kings County

Brooklyn last year had the lowest maternity death rate of any borough in the city and the lowest in its history, Dr Charles A Gordon told a gathering of leaders in social welfare work at the seventh annual Mother's Day luncheon of the Maternity Center Division of the Visiting Nurse Association of Brooklyn, at the Hotel St George on May 1.

Dr Gordon, chairman of the special committee on maternal welfare of the Kings County and the New York State Medical societies, attributed much of the gain in the battle against maternity death to the work of the Maternity Center Division.

He thanked the assembled division workers particularly for their cooperation with the county medical society in furnishing data for the obstetric conferences held monthly under the medical society's auspices. These conferences, said Dr Gordon, at which, since 1936, all borough physicians have been invited to discuss obstetric cases, constitute a "unique mechanism" that has contributed greatly to the reduction of maternal deaths.

The need of some means of making medical care available to the poor without leaving that burden on the shoulders of the private physician was stressed in an address by Dr Fred L Adair, chairman of the American Committee on Mater-

nal Welfare and chief-of-staff of the Chicago Living-In Hospital

"Vast changes have taken place in medical practice in the last generation," said Dr Adair. "Not only has the period of education and training for the doctor been increased but the equipment needed has become more elaborate and expensive and the technics of diagnosis and treatment more exacting. The time and care a physician must devote to every case have greatly increased, and this without regard to whether the patient pays or not."

"The doctor no longer can carry the load of charity practice. Some readjustment must be made in order to spread good medical care throughout the country."

Asked later whether he meant socialized medicine, Dr Adair replied, "It isn't a question of the doctors opposing or favoring any particular solution of the problem, but of arriving at some proper technic or method of getting medical care to those who need it."

A regular monthly meeting of the Rugeboro Medical Society was held at the Shore Road Hospital on May 8.

The paper of the evening was "Intra-cranial Hemorrhage" by Dr Joseph Globus, associate neuropathologist of Mount Sinai Hospital, neurologist, Letchworth Village, and consultant neurologist, Southside and Mather Memorial.

The discussion, from the surgical aspect, was led by Dr E Jefferson Browder, neurosurgeon of the Brooklyn and Kings County M-E, Holy Family, St. Giles and Beth Moses hospitals.

Dr Herbert Gordon, of Far Rockaway, was elected president of the Rockaway Medical Society on April 17 at a meeting in the Lawrence Country Club.

Other officers elected are Dr Irving G Frohman, vice-president, Dr Grnsword Nammack, treasurer, and Dr Archibald O Wood, secretary.

Nassau County

There are 484 actively practicing physicians in Nassau, according to an inventory by the county society, of whom 38.4 per cent are within draft registration age. Only 10.1 per cent are more than 55 years of age and 8.4 per cent are members of the society, reports J Louis Neff, executive secretary.

New York County

The Graduate Fortnight of The New York Academy of Medicine will be held from October 13 to 24, 1941, the subject this year being "Cardiovascular Diseases Including Hypertension."

The Fortnight will present a carefully integrated program which will include morning panel discussions, afternoon clinics and clinical demonstrations at hospitals of New York City, evening addresses, and a scientific exhibit. The evening sessions at the Academy will be addressed by recognized authorities from leading medical centers of the United States and Canada. The comprehensive exhibit will include books and roentgenograms, pathologic and research material, clinical, laboratory, diagnostic, and therapeutic methods. There will be demonstrations of exhibits and of fresh pathology.

At the meeting of the Section of Dermatology and Syphilology of The New York Academy of Medicine on May 6, case presentations were given by the Beth Israel and Brooklyn Jewish hospitals and the Cornell Medical College Clinic, with a general discussion.

A combined meeting of the Section of Neurology and Psychiatry of The New York Academy of Medicine and the New York Neurological Society was held at the Academy on May 6, with papers on "Salvarsan Encephalitis," "Brain Abscess," and "Electrical Injuries of Central Nervous System."

Dr James Ewing of Memorial Hospital gave an address on "Problems in Traumatic Cancer" before the Society of Medical Jurisprudence at the Academy building on May 12.

The French Medical Society of New York had as its guests on May 15 at the New Amsterdam Hospital, the Sociedad Medica Hispano Americana, the American-Hungarian Medical Association, the Italian Medical Society, the Russian Medical Society, the Rudolf Virchow Medical Society, and the International Medical Club of New York.

The program was as follows: addresses (with projections) "Suture and Canicature in Medicine" by Dr Victor Robinson, professor of history of medicine, Temple University School of Medicine, and "Travels of a Doctor," by Dr Howard Fox, emeritus professor of dermatology and syphilology, New York University College of Medicine.

Oneida County

At the May 15 meeting of the Utica Academy of Medicine at the Hotel Utica, Dr D Anthony D'Esopo, Columbia University Medical Center, New York City, spoke on "The Occipito-Posterior, Its Mechanism and Treatment," with the discussion opened by Dr Keith Preston and Dr P P Gregory. Dr Karl Gruppe spoke on "Bronchoscopy in Diagnosis," with the discussion opened by Dr William Jensen and Dr R C Hall.

Ontario County

Dr William Eikner of the Clifton Springs Sanitarium staff was guest speaker on May 8 at the monthly meeting of the Canandaigua Medical Society, substituting for Dr Adrian S Taylor, scheduled speaker. Dr J Wendell Howard was host at Hallway House, East Bloomfield.

Dr Eikner discussed "Use of Continuous Spinal Anaesthesia," giving case reports from the sanitarium since January 1. Dr Hubbard K Meyers, president, conducted the meeting which followed dinner served to fifteen.

Dr C Harvey Jewett will be host for the next meeting, June 12, when Dr C J Bobeck will give a paper on "Cardiac Arrhythmias."

Otsego County

The Otsego County Society met on April 9 at Cooper Inn, Cooperstown, and on May 14 at the Hotel Oneonta, Oneonta. At the former meeting, the second of the 1941 postgraduate lectures was given by Dr M B Handelsman, associate in medicine, Long Island University Medical School, on the topic "The Diabetic Patient and the General Practitioner."

At the latter meeting, the third lecture was given by Dr M V Armstrong, assistant clinical professor of obstetrics and gynecology, Long Island University Medical School, on the topic "How Can the Obstetrician Aid in Reducing the Mortality of Prematurely Born Infants?"

Richmond County

Dr Nathan B Van Etten, president of the A.M.A., addressed the county society at its annual dinner on May 7

Dr Arthur S Driscoll, of Grymes Hill, who died on April 27, was president of the county society from 1934 to 1935 and was vice-president of the state society in 1937

Rockland County

The spring meeting of the county society was held on April 23 at the Rockland State Hospital, Orangeburg

The medical portion of the afternoon was devoted to a lecture on "Cardiac Treatment" by Dr Louis F Bishop, Jr, attending physician at Bellevue Hospital, New York City, illustrated by lantern slides. Following the business and scientific sessions, the members were the supper guests of Dr Russell E Blaisdell.—*Reported by W J Ryan, M D, Secretary*

Schenectady County

Dr Will Cook Spain spoke on "Hypersensitivity to Common Foods" at the meeting of the county society on May 6 at the nurses' home auditorium, Elba Hospital

Dr Spain is chief physician in allergy at the Post-Graduate Hospital, New York. Preceding his lecture was a short discussion on allergy to liver extract by Dr Arthur H Congdon

Ulster County

The regular spring meeting of the county society was held on May 7 at the Governor Clinton Hotel in Kingston. The business session was followed by an informal program arranged by Dr E F Shea. Dr Peter Irving, of New

York City, secretary of the State Medical Society, spoke on the administrative activities of the State Society. Dr Joseph S Lawrence of Albany, told of his work as legislative executive officer of the State Society

Westchester County

The county society will have a dinner-dance on Saturday evening, June 14, at the Westchester Country Club, at Rye

Dr Camillo A Cerchiara was elected president of the Mount Vernon Medical Society to succeed Dr Mark G Khatsheo, returning head, at the annual spring dinner meeting on May 8 at the Pelham Country Club. More than forty-five members attended the dinner, which followed an afternoon of golf

Named to succeed Dr Cerchiara as vice-president was Dr Fred L Vosburgh, former secretary. Dr George A Bochow was selected for the secretary's post, while Dr William A Randell was renamed treasurer

At a stated meeting of the Yonkers Academy of Medicine, on April 16, at the Hudson River Country Club, Dr Charles Lee Buxton of Sloane Memorial Hospital offered a paper on "Endocrine Therapy in Gynecological Disorders." Discussion was opened by Drs Jacob Kertzman and Richard C Young

The Westchester County Society of Gastroenterologists met at the New York Hospital, Westchester Division, on April 25, and Dr Arthur J Patek, Jr, of the Research Division for Chronic Diseases at Welfare Island, spoke on "Treatment of Cirrhosis of the Liver." Dr Carl Greene, of New York City, opened the discussion

At a regular meeting of the New Rochelle Medical Society on April 14, Dr Anthony Bassler, F A C P, of New York City, president of the National Gastroenterological Association, presented a paper on "The Intestine and Chronic Arthritis"

Hospital News

Helping the Fellow Who Can't Pay the Full Bill

WE ALL know the problem of the man who can support himself under ordinary conditions but finds the added burden of illness more than he can carry, remarks Dr T. R. Ponton, editor of *Hospital Management*. He notes that at the recent meeting of the Western hospitals Dr Ginsburg, of Fresno, told how his hospital and its medical staff had been assisting this man since 1933. Briefly, the basis of the plan is to investigate the patient's ability to pay without serious financial handicap. After this he is charged a total fee based on the results of this investigation. The hospital gets a reduced rate for its services and the physician also accepts a partial fee. The result is that everybody is better off.

The most striking illustration of this mutual arrangement is in the Baker Memorial, a part of the Massachusetts General system. In this hospital the patient is not admitted if he is really indigent or if he is able to pay full charges. It is the medically indigent and borderline cases that are cared for. The hospital charges a rate which is below cost and the physician also receives a partial fee. In this case the feeling of confidence between the hospital and the members of its medical staff is so complete that the hospital investigator usually determines the amount of the physician's fee.

"Years ago," Dr Ponton recalls, "I worked out a similar scheme at the Illinois Masonic in Chicago. We had a large class of Masonic charity, much of which needed assistance rather than charity. Every case was investigated. The members of the medical staff agreed that they would care for the patient at a fee not greater than the hospital bill."

Dr Ponton gave the details of the plan as follows:

1. The financial status of every patient applying for Masonic charity was investigated.
 2. By conference with the patient it was determined how much he would be able to pay for his care.
 3. The normal hospital bill was estimated.
 4. The physician's fee was fixed, patients being assigned to the staff physician on service.
 5. A credit agreement was entered into whereby the time was fixed when payment of the account would commence and the weekly amount would be paid.
 6. When payments commenced the first was applied on the hospital bill, the second was turned over to the physician and so on until both were paid at the originally agreed rate.
- "The result was remarkable," said Dr Ponton. "We reduced our Masonic charity, the hospital received part of its cost of care, the physician was paid a reasonable fee but, best of all, the patient was not pauperized."

Buffalo General Serves Tea

LET'S stop in for tea at Buffalo General Hospital, Buffalo, New York, suggests the

"Roving Reporter" of the *Modern Hospital*. It's their invitation. Surely there could be no more attractive place in which to spend a few minutes enjoying tea and cookies than the large solarium on the first floor. If we're fortunate we'll strike an afternoon when the Hammond organ is being played by one of the employees who, incidentally, enjoys quite a reputation as an organist.

"This practice was started about a year and a half ago," Dr Fraser D. Mooney, superintendent, tells us, and he adds, "we wouldn't think of discontinuing it."

"First, it serves as a nice 'pick-up' at a time when people are tired. Second, it is much appreciated by ambulatory patients, nursing staff, attending staff, house staff, office staff, visitors—in fact, by anyone in the vicinity who happens to drop in for tea with us. Third, from a public relations and personnel relations angle we believe it to be valuable. Fourth, the added efficiency caused by the short rest and tea and cookies we believe more than pays for the upkeep—it probably averages between \$400 and \$500 a year."

So don't forget, the invitation stands: tea at Buffalo General every afternoon between 4 and 5 o'clock with the exception of Saturday and Sunday. The average time thus spent is about ten minutes and, believe it or not, the courtesy hasn't been abused—by patients, personnel, or public.

Bad Luck for the Sick Poor

IT WAS "bad luck for the sick poor," says the *New York Times*, when in April the New York City Board of Estimate defeated a motion of Borough President Lyons of the Bronx to add \$460,000 to the sum allowed voluntary hospitals for handling city cases. Even if this money had been allowed it would not entirely have relieved what is really a scandalous situation. The municipally operated hospitals are badly overcrowded. The private hospitals are about three-fourths full. The city now pays \$3.00 a day for city patients received in the private hospitals, which is not only a lower rate than that paid in up-state hospitals doing a similar service, but is between one and two dollars less than it costs the hospitals to care for the patients.

"This ratio of services paid for to services rendered cannot be kept up indefinitely. Hospitals that already find it hard to balance their budgets cannot afford to fill their empty beds at a collective cost of \$5,000 or more a day. Nor can the city save money in the long run by pinchpenny dealings with them. It might save money by filling the empty private beds at a fair price and thus avoiding the necessity for more municipal hospitals."

"There is no argument as to the facts. More than two years ago Mayor La Guardia made an appeal to 'strengthen the position' of the private hospitals. Nearly a year ago the situation was clearly presented in the report of the Thacher Committee, working under the auspices of the

At the latter meeting, the third lecture was given by Dr M V Armstrong, assistant clinical professor of obstetrics and gynecology, Long Island University Medical School, on the topic "How Can the Obstetrician Aid in Reducing the Mortality of Prematurely Born Infants?"

Richmond County

These, too,
ARE PART OF THE B COMPLEX

The necessity for administering whole Natural Vitamin B Complex, rather than mixtures of a few chemically synthesized constituents, is brought out clearly in current literature

THEY'RE ALL ESSENTIAL—In prophylactic and replacement therapy, it is therefore important to prescribe the whole B Complex, including those factors which cannot be synthesized

BEZON

Trade Mark

is the product which contains the entire Natural B Complex in such high potency that a single capsule provides a full day's dosage.

Each Capsule of Bezon contains

Thiamin	(Vitamin B ₁)	1000 micrograms
Riboflavin	(Vitamin G)	1000 micrograms
Nicotinic Acid	(P-P Factor)	150 micrograms
Pyridoxane	(Vitamin B ₆)	35 micrograms
Pantothenic Acid	(Filtrate Factor)	225 micrograms
together with all the other known members of the Natural B Complex		

NOTE THESE ADVANTAGES

Of outstanding importance to the physician in everyday practice are the following therapeutic advantages of Bezon

POTENT . .
The full day's dose in a single capsule

BALANCED .
A proper ratio exists between the various factors

COMPLETE
The entire B Complex, not just a few factors.

CONVENIENT
No messy syrups or liquids, no bulky medication

NATURAL
Entirely derived from natural sources.

BEZON
Is available in bottles of 30 capsules — a month's supply

Dr _____ Address _____

Hospital Council of Greater New York Nothing was done about it An increased appropriation is again refused This is short-term and misleading economy It is long-term waste The Board of Estimate ought to reconsider

Newsy Notes

THE New York State Hospital Association has completed preliminary tabulations of a survey made to determine the patient bed facilities that could be made available without new construction, reports *Health News* Two hundred fifty-five member hospitals report that in case the present emergency warrants expansion of bed facilities they would be able to provide 26,650 more beds These hospitals report further that the operation and maintenance of these supplementary facilities would necessitate the additional expenditure of \$2,159,100 and the employment of more than 10,000 additional employees

This information has been forwarded to the Legislative Commission to Formulate a Long Range Health Program and will be available shortly as part of an interim report It will be sent, together with the results of a survey of ambulance services and schools of nursing now nearing completion by the New York State Hospital Association, to each of the county advisory health preparedness committees of the state

The WPA has started a training program to prepare men and women for work as hospital attendants There is at present a serious need for these subsidiary workers in city hospitals and institutions, and their value would be increased manifold during any local or national emergencies that might arise, Major Irving V A Hue, WPA administrator for New York City, announces The training course opened with the first fifty men and women selected for the work, to be augmented every three weeks by fifty more trainees until the full complement of 350 is in training Materials, supplies, and equipment as well as the teaching staff of registered nurses will be supplied by the Department of Hospitals Facilities of the Welfare Hospital on Welfare Island will be used for the WPA training courses through the cooperation of Dr Christman G Scherf, medical superintendent

According to its manufacturers, says *Hospital Management*, the fastest field x-ray unit of its kind in the world will enable the United States Army to examine wounded soldiers at the rate of one every minute The new unit, built by Westinghouse X-Ray Co, Long Island City, New York, is designed to locate the position of bullets and shell fragments in injured men isolated from hospital facilities

Westinghouse states that the portable x-ray equipment can be erected in ten minutes on a battlefield and is adaptable for almost all types of x-ray studies, though it is designed particularly for direct studies of the patient without the need of films Provision is also included for

making ordinary x-ray pictures The exact point at which a bullet has entered the body of a patient and the depth to which it has penetrated can both be determined in a sixty-second examination, it was reported

Two hundred and four families living in Chenango County have borrowed money from the Farm Security Administration of Washington to enroll in the nonprofit community Ward Service Hospital Plan, Inc, reports the *Bainbridge News*

These families representing a total of over 800 people will be received in the hospitals of their choice for benefits described in the contracts of Hospital Plan, Inc

The checks covering their subscriptions are forwarded to the Plan by the Government Bureau

This is the first enrollment of its kind that has taken place in this section of the country and word has been received at the Norwich office of the Plan that similar arrangements are being made to extend the same privileges to agriculturists living in Otsego County who are being aided by the Farm Security Administration

Each subscriber is entitled to eighteen days of care in ward accommodations with general nursing, meals, special dietary services, drugs and dressings, operating room and delivery room, and ambulance service within the corporation limits of the participating hospitals

Seventy "men in white" appeared before the Board of Estimate of New York City in April and criticized as a "municipal scandal" the \$18 a month paid to the city's interns Dr William Obrinsky, chairman of the legislative committee, New York Region, Intern Council of America, served as spokesman

"The principle of pay for interns has already been established," he declared The time has come to convert this principle into a practice. The Intern Council recommends that the salaries of all residents and assistant residents be established at a uniform level of \$1,200 a year, and that interns be given a salary of \$1,000 a year"

Dr Obrinsky pointed out that contrary to the Mayor's annual budget message of well-staffed and well-organized institutions, the city's hospitals are under-staffed, poorly equipped, and "dangerously" overcrowded He added that interns are handicapped in their work because of lack of sufficient help, including nurses and technicians The speaker continued

"The Mayor in his budget message expressed considerable sympathy for the overworked and underpaid nurses and hospital workers but not a single word did he have for the equally underpaid and equally overworked interns"

It also was pointed out that the intern is a licensed physician, trained for eight years at a cost of \$15,000, is 27 years old on the average, receives 60 cents a day for his services, and is "the lowest paid of all public servants, including teachers-in-training, rookie policemen, firemen, etc"

Baby Chicks *Save* Babies' Lives

HEMORRHAGIC disease of the newborn is a potential threat to all infants. If not fatal, intracranial hemorrhage may result in permanent mental or motor disability. The disease is invariably associated with prothrombin deficiency. Vitamin K has been shown to be necessary for prothrombin formation and a highly potent and economical vitamin K active compound is now available.

More than 15,000 baby chicks were used in studies which resulted in the demonstration that 2-methyl-1, 4-naphthoquinone (now available under the name Thyloquinone) possessed vitamin K activity greater than the natural anti-hemorrhagic vitamins K_1 and K_2 . It is rapid in action even on oral administration and its effect in reducing prothrombin clotting time is evident within a few hours.

Thyloquinone is indicated with "bile salts" in combating and preventing hemorrhagic tendencies in obstructive jaundice and biliary fistula. Many writers have recommended the administration of "vitamin K" as an obligatory routine measure in maternal care. The suggested dose is 2 mg by mouth at the beginning of labor and then 1 mg in six hours if the patient is still in labor.

Thyloquinone in Oil is available for oral use in 1 mg miniature capsules (boxes of 20, 50 and 100) and in 5, 10 and 50 cc bottles. Also in 1 cc size ampuls, each containing 2 mg for parenteral administration.

A leaflet describing in detail the various dosage forms of Thyloquinone and their use is available to physicians. Write Professional Serv. Dept. 745 5th Ave., New York.

E. R. SQUIBB & SONS, NEW YORK
MANUFACTURING CHEMISTS TO THE MEDICAL PROFESSION SINCE 1858

(Continued from page 1202)

Seventy-five beds and two ambulances of the Downtown Hospital and Pan-American Clinic, 129 Broad Street, New York City, have been dedicated to catastrophe service, and the formation of the hospital's Medical Emergency Defense Unit, consisting of twelve members of the institution's medical staff and fifteen of its nurses, is announced.

The emergency unit will be available at all times of day or night to go to the scene of any fire, explosion, or other catastrophe or to piers upon the arrival of ships bearing victims of maritime disasters.

The beds occupy the entire fourth floor of the eleven-story hospital building, and those on the eighth, ninth, and tenth floors will be made available if the need arises.

. . .

Among the many bills passed at the closing session of the Legislature was one authorizing the towns of Afton, Bambridge, Sidney, Guilford, Unadilla, and Masonville, or any two of them, to establish a joint public hospital district, to acquire land, build, and equip a general hospital, and to conduct and operate the same. The bill carried no appropriation and was merely an act permitting the people of the locality to get together and decide whether or not they wish to have such a hospital and, if so, just which towns wish to support the movement and pay the necessary taxes needed to build and operate such an institution.

. . .

St. Clare's Hospital, New York City, announces a plan to provide free hospitalization for underprivileged babies for a month after their birth in the hospital as a step toward reducing the death rate of newborn infants.

The plan, believed to be the first of its kind, will go into operation next fall when a building now under construction on 52nd Street, between Ninth and Tenth Avenues, is completed.

Under the plan a mother may leave her baby in the hospital for thirty days after its birth while she herself returns home or, as is often the case, to work.

.

American Red Cross and military officials recently witnessed a demonstration of a tubular iron stretcher carrier that is designed to convert an ordinary truck into an ambulance at a moment's notice. The frame is adjustable so that it can be made to fit into any size truck. It was developed by Mabel T. Boardman, national secretary of the Red Cross, and costs about \$25, says the *Modern Hospital*.

Red Cross chapters throughout the country will be urged to obtain the stretcher carriers and train volunteer units, to be known as "truck ambulance companies," to operate them.

Improvements

The division of health of the Catholic Charities of New York will spend more than \$2,000,000 this year to extend the facilities of the twenty-six general and special hospitals affiliated with the charities, the Rev. John J. Bingham, director of the division, says in his annual report.

. . .

A \$355,000 WPA improvement job is under way at the Veterans' Hospital, 130 West Kingsbridge Road, New York City, and an additional \$500,000 improvement job is contemplated for the new fiscal year starting on July 1, it is announced by Major Irving V. A. Hue, WPA administrator for New York City.

Since WPA improvements to the hospital in the past totaled \$725,000, Major Hue said, by the time the present program is completed the hospital will have benefited to the extent of \$1,580,000.

. . .

Flushing Hospital is to have a new three-bed room in its maternity wing, given by the Soroptomist Club.

. . .

Mercy Hospital, Buffalo, will install a new x-ray machine.

.

St. Francis Hospital, Olean, has a new iron lung, the gift of generous citizens.

"IT CAN BE DONE"

Dr. Gordon Park Jackson, Health Officer of Toronto, Canada, a city of 800,000, reports that his city did not have a single case of diphtheria in 1940. This world's record for a city of Toronto's size in the control of one of the most dreaded preventable diseases of childhood did not occur by accident, declares the *Kentucky Medical Journal*. It was the logical and direct result of an intelligently planned and actively prosecuted educational campaign by health authorities to secure the cooperation of the general public, especially parents, in immunizing preschool children. For the past ten years, Dr. Jackson and his assistants have sought by every available means to persuade the parents of every

newborn child to have the child immunized between the ages of 6 and 9 months. To this end every medium at their command was utilized—lectures before parent-teacher associations and civic and business organizations, radio addresses, moving pictures, posters, newspapers, and the distribution of literature. Every school in Toronto was visited and susceptible pupils immunized. In this way the great majority of children who were not protected during the preschool age were rendered immune to the disease. At the close of last year 80 per cent of all the school children in the city had been retested and found to be immune. The same means will produce equal success anywhere.

LORENZ J. BROSNAN, Esq

Counsel, Medical Society of the State of New York

Responsibility of Surgeon for Care Following Operation

IN A nearby state very recently an important decision was handed down in a case involving the liability of members of a hospital staff for negligence of other persons attached to the same staff.*

The action was brought against the defendant, a practicing physician and surgeon, who was associated with the staff of the H hospital as assistant surgeon. The plaintiff entered the hospital as a ward case, paying for hospital care but receiving medical and surgical care free of charge from members of the staff. The chief of the hospital staff designated an intern to perform the operation and the defendant to be present as assistant. The operation was a simple one, consisting of the amputation of a little toe. It was performed, and at its conclusion the resulting wound was packed by the intern with a folded strip of vaseline gauze, after which the entire foot was bound up with plain gauze.

After the operation the patient was sent to the ward "where the aftercare was in the hands of surgeons assigned to the ward by the house staff." The defendant after being present at the operation as assistant to the operator had no further connection of any sort with the care of the patient.

It seems that the patient stayed in the hospital for three weeks, and upon leaving there was still some discharge from the stump. Ulceration followed and, while under the care of his personal physician, a piece of gauze which had apparently been in the wound since the operation was removed. There was a spread of infection with injury of a serious nature.

The case was tried before the Court without a jury and upon such a showing of facts as above outlined, the Trial Court concluded that the defendant was under no duty to treat or care for the plaintiff after the operation and, accordingly, judgment was entered in favor of the defendant.

An appeal was taken by the plaintiff but the Appellate Court affirmed the judgment appealed from. In the opinion the Court said in part:

"The plaintiff had the burden of proving that the defendant failed to exercise that degree of care, skill, and diligence ordinarily had and exercised by physicians and surgeons engaged in the same line of practice in the general neighborhood of H. If there was negligence constituting malpractice, it occurred during the aftercare. No claim is made that there was negligence in connection with the operation itself, which was the only connection the defendant had with the patient's care or treatment. Therefore, the plaintiff must prove that there was a legal obligation on the part of Dr. Q. to treat the patient after the operation and that he failed in that duty. The facts found do not indicate that

there was such proof, they show that there was no such duty. The defendant was assigned to the case for the sole purpose of assisting in the operation itself. The aftercare was in the hands of other surgeons assigned to the ward by the Chief-of-Staff. The defendant was on duty in the women's ward only and had no connection with the aftercare of this patient. Upon these facts, as the Trial Court aptly stated, 'the only sound and reasonable conclusion is that defendant's duty ended with the service in the ward. No other holding would be consonant with the exigencies of the modern hospital setup.'

"The plaintiff's argument assumes that the patient and the defendant entered into a contract whereby this defendant agreed to treat and care for the plaintiff's condition during his hospitalization, and cases are cited holding that the physician is bound to continue treatment as long as the contract is in force. This assumption runs contrary to the facts found in this case, which discloses that the undertaking of the defendant was limited to assistance at the operation. The cases cited are not in point.

"The principal claim made in the plaintiff's assignments of error was that the defendant was under a duty to either remove the pack himself, within a reasonable time after the operation, or by examination see that someone else removed it. That duty could be established by expert evidence as to the practice of surgeons in the community in like cases, and that in such cases the operating surgeon also personally performed aftercare, by which the basis would be laid for a finding of neglect by a defendant who had not conformed to the general practice, where the plaintiff might rely on the only generally recognized exception to this rule, and upon mere proof of the facts of the doctor's treatment or lack of it, claim that those facts established 'such obvious gross want of care or skill as to afford, of itself, an almost conclusive inference and dispense with the necessity of testimony by expert witnesses.' As we have stated, there is not a suggestion in the finding that in failing to remove the gauze personally or in failing to give personal aftercare or supervision the defendant fell below the standards set by the profession in similar circumstances.

"The plaintiff is left with the claim that because Dr. Q. was present and assisted at the operation he was guilty of obvious and gross misconduct in permitting the aftercare to pass into the hands of other licensed physicians and surgeons. We adopt the reasoning of *Hunner vs. Stevenson*, 89 A 418, p 421, where the Court said:

"The theory of the defendant on the main

Successful Clinical Experience
Suggests . . .

Carnacton

Biologically Tested
Diaphragmatic Muscle Extract

Carnacton serves effectively in *Angina Pectoris* particularly the variety known as "angina of effort" where angiospasm is the dominant factor, and *Arteriosclerosis* cerebral and general. In this condition its action is not limited to a temporary vasodilation but promotes a gradual collateral circulation. The vegetative nervous function was improved in many of the cases observed.

This muscle extract has also demonstrated efficacy in *Cardiac Dyspnoea*, *Cardiac Asthma* and *Obliterative Arterial Diseases* especially in which intermittent claudication is present. Carnacton appears to exert a tonic and vasodilating action on the circulatory system, with a sedative effect on the neuro-psychic sphere.

LATIMER LABORATORY, INC., DEPT. A-6 41 EAST 21 ST., NEW YORK

[Continued from page 1206]

question is thus stated in the brief filed in his behalf "That an operating surgeon at a hospital of repute in the case of a wound left open is not liable for the negligence of hospital, surgeons, nurses, or interns in the after dressing of such wounds, if such operating surgeon is without knowledge of, or in privy to, such negligence." At this date, when it is well known that there are physicians and surgeons of special skill in particular practice of their profession, it could not safely be announced as a general rule of law, applicable to such cases as this, that a surgeon who performs an operation is liable for the negligence

of other physicians, nurses, or interns in hospitals in the after treatment, unless he specially undertakes such employment."

The Court further said

"We conclude that in the absence of facts tending to show that there was a contractual duty on the part of the defendant to furnish aftercare, or that under the situation disclosed, the relationship of doctor and patient carried with it the duty of aftercare, the defendant was entitled to follow the hospital system, which, as the finding shows, divorces the operation from the aftercare and puts the aftercare in the hands of other surgeons."

Inquiries

YOUR Counsel recently received the following inquiry

"Dear Mr Brosnan

"Would you be so kind as to furnish me with some advice relative to the liability of a physician working in a hospital clinic?

"The hospital in question is the E Hospital where we intend to open a charity clinic, charging a nominal sum of 25 or 50 cents to cover expenses. I am to be the chief of all the clinics not actually working therein. I would like to know if the patients, in the clinic, could sue the chief although not actually participating in the treatment or if they could sue the individual doctor in charge of the clinic at the time. In case of an intern treating the patient at that time could he also be sued or both he and the attending in charge of that clinic or all, the intern, attending in charge at the time together with the chief of all the clinic departments?

Very truly yours,"

Your Counsel's reply was as follows

"Dear Doctor

"It is not possible, in the absence of the actual facts of a case, to give a definite opinion as to liability or nonliability, since the factual situation may change the legal principles to be applied

"I would say that the chief or director of a clinic, who does not personally see, treat, or issue instructions for the treatment of a patient, would not be responsible to that patient in the event that the patient claimed that

he was improperly treated. Such was the ruling by the Appellate Division of the First Department in a recent case

"Insofar as Doctor N was concerned, it is rather difficult to understand the theory upon which the case against him was submitted to the jury. The testimony from the trial indicates quite clearly that he did not treat the respondent. As head of the surgical division, he made the rounds of the wards, he did not ordinarily examine the patients. He did not read the plates which were taken of the patient's injured leg, nor did he owe any particular duty to him since it appears that the patient was under the care of Doctor K and Doctor C. Furthermore, it appears that Doctor K did not even discuss the case with him."

"I may add that this case was taken to the Court of Appeals and the action of the Appellate Division unanimously affirmed

"Of course, the patient could sue any doctor and this includes an intern who was in attendance on his case. This will include any doctor who, despite the fact that he had not seen the patient, undertook to issue specific instructions with respect to the patient's care

"I can conceive of a situation involving some administrative defect in the running of the clinic which, if resulting in injury to a patient might possibly involve the head of the clinic as well as the individual doctor in charge of the clinic at the time, but I believe the possibility of this happening would be rare

Yours very truly,"

ARTIFICIAL INSEMINATION

Up until June, 1940, according to a recent questionnaire sponsored by the National Research Foundation for Eugenic Alleviation of Sterility there have been 9,238 children born in the United States as a result of artificial insemination, notes the *Virginia Medical Monthly*. Five thousand seven hundred and twenty-eight of these children were produced by artificial insemination in which the husband of the mother was employed. In 3,510 cases, donors were used. More than 5,000 doctors participated in these reported results

Apparently it was not always easy to bring about pregnancy by artificial insemination, but in some instances many unsuccessful attempts were followed by a satisfactory result. One

hundred and twenty-four physicians, for example, reported final success in cases after more than 21 failures at insemination. Among those artificially inseminated, 23 per cent miscarried, there were 22 extrauterine pregnancies and 44 flare-ups of previously existing infection

The medical profession has gone a long way, eugenically speaking, since the days when they fought over contraceptive advice as a eugenic and economic measure. Artificial insemination of human beings using material from donors is something few of us would have dreamed of a decade ago. Few of us would dream today that it is being practiced on such a wide scale as this survey has revealed

Woman's Auxiliary

To the Medical Society of the State of New York

THE Sixth Annual Convention of the Woman's Auxiliary to the Medical Society of the State of New York convened at the Hotel Statler, Buffalo, on April 28 to May 1. Three hundred and twenty-nine doctors' wives were registered.

The women of the Erie County Auxiliary were perfect hostesses. Congratulations should be extended to Mrs. Carlton E. Wertz, convention chairman, and to her committee whose thoughtful planning afforded us so much comfort and pleasure.

The opening meeting was called to order Monday at 10:45 A. M., by the president, Mrs. Luther H. Kice. The invocation, by Father Timothy J. Coughlin, was followed by a pledge of allegiance to the Flag of Our Country, led by Mrs. Albert M. Bell. This was followed by a Prayer. Mr. John Sturgess was soloist at the Memorial Service which was very impressive.

Mrs. V. E. Holcombe, national president of the Woman's Auxiliary, was our gracious guest of honor.

Mrs. Luther H. Kice, president, gave a complete report of her work. Three new counties, Essex, Montgomery, and Niagara, were organized during her term of office. We are deeply indebted to Mrs. Kice for carrying us through another successful year, which has brought us added interests and an enlarged circle. A short report was given by Mrs. George B. Adams, president-elect. All members of the board, chairmen of standing committees, and all county presidents reported that efficient work is being carried on. The state officers and the delegates to the National Convention were elected. Speakers on Monday were Dr. James Flynn, president of the State Society, and Dr. Louis H. Bauer, speaker of the House of Delegates.

On Tuesday morning a postconvention meeting was held. Mrs. George B. Adams, our new president, called the meeting to order.

Dr. Samuel J. Kopetsky, president of the State Society, addressed the meeting. He advised us to keep "Our Home Front" secure. Mrs. George B. Adams appointed the executive committees for the year. The project for the year will continue to be the Physicians' Home.

The trend of thought during the convention was "To be able and ready to respond to any national emergency during this period of world crisis."

The National Woman's Auxiliary Convention will be held June 2 to 6, in Cleveland, Ohio, with headquarters at Hotel Carter.

Mrs. Clarence J. Durshordwe, chairman of this year's Hobby Show, used excellent judgment in staging and arranging the exhibits. The orchids exhibited by Dr. and Mrs. Arthur R. Gibson prove that doctors have patience.

The Sixth Annual Birthday Dinner was held in the Ballroom of the Hotel Statler. The room was beautifully decorated with wisteria. The decorations were made by members of the Erie County Woman's Auxiliary. Mrs. V. E. Holcombe, national president, was the guest speaker. We were inspired by her interesting and helpful

address. A beautiful silver tray was presented to Mrs. Luther H. Kice, retiring president. Pins were given to all past state presidents. A program of music and dancing was enjoyed. In conclusion, the Reverend Arthur Walwyn Evans, D. D., delivered a humorous talk, "The Mirth of a Nation."

On Tuesday afternoon a delightful tea was given at the Twentieth Century Club. On Wednesday a luncheon was served in the Georgian Room of the hotel. Mrs. Luther H. Kice acted as toastmistress. We were honored by the presence of Dr. Nathan B. Van Etten, president of the American Medical Association. The speakers were Dr. Chas. Gordon Heyd and Dr. A. H. Aaron. A fashion show was presented during the luncheon. On the program was Mrs. Clyde L. Randall who entertained everyone with an excellent whistling solo. Sight-seeing trips and a trip to Niagara Falls brought the activities of a well-planned convention to a close.

We are greatly indebted to the Erie County Auxiliary for the splendid program and entertainment and to the Hotel Statler management for their excellent service. We extend our appreciation to Mrs. Luther H. Kice, the retiring president, and best wishes to Mrs. George B. Adams, our new president, for continued progress and cooperation. Let us pledge to her our whole-hearted interest and aid for the year 1941 to 1942.

"THE DOCTOR IN THE KITCHEN"

"Invalid cookery," quoting an English book on this important subject by Mrs. Arthur Webb, "should consider the likes and dislikes of the patient."

This is probably one of the few points in diet on which everyone would agree. Doctors will agree, too, that food properly prepared and given to the patient at the right time and in the right quantities is important in the mental and physical care of every case. First, in the early stages of serious illness to sustain life, and secondly, in later stages and in convalescence to build up strength and lost weight.

Here is the reason why the private sanitarium is often the answer to the question of obtaining suitable care and treatment following surgery and during the con-

valescent stage of serious illness. Sanitariums, without exception, give a great deal of thought and consideration to dietetic problems. Equipped to give the necessary time to individual requirements, the sanitarium is in a position to follow the patient's personal medical adviser's own directions for diet when asked to do so. Or, where no special diet is necessary, the physician may still feel that proper nourishment, in spite of food whims of his patient, is receiving constant attention.

How food is prepared and how it is served often marks the difference in the desire of patients to eat. The homelike atmosphere of the private sanitarium may have considerable influence in this direction, too.

SOOT, OIL, AND CANCER

At one time, chimney sweeps headed the list of cancer death rates. This is no longer the case, mainly because they have been able to adopt higher standards of cleanliness. But their death rate from cancer is still far above the average. Fifty years ago the chimney sweep's black skin was regarded as a joke. We now realize that if a sweep has to live in a house without proper washing arrangements he is probably condemned to death from a particularly unpleasant kind of cancer. Gas workers are affected in a rather similar way. The substances in soot and oil which cause cancer were isolated by Professor Kennaway of the London Cancer Hospital, and his colleague Cook discovered their exact composition. It is now possible to test lubricating oils for their presence.—*Haldane, J. B. S. Science and Everyday Life, New York, Macmillan Company, 1940, quoted in J. A. M. A.*

COMMON SENSE

While it probably would not be democratic to state that an eligible young man shall not be drafted simply because he is a doctor, we do not feel it would be against the public interest or the principles of democracy to state that since there is a threatened shortage of doctors in the country a doctor shall not be drafted except as a doctor. It does not seem like good economy to take a perfectly well-trained doctor out of civilian practice and turn him into a machine gunner, a potato peeler, or what the Navy used to call a "Captain of the Head."

Without presuming to interfere with the orderly processes of democracy we cannot refrain from expressing the hope that as the draft machinery is developed some way will be found of making certain that doctors and dentists called into the Army are put to work where they will do the most good.—*Nassau Med News*

Editorial

Dr. Wilbur Comments

In a letter to the Editors, dated May 17, 1941, Dr. Ray Lyman Wilbur, president of Stanford University, says of our recent editorial, "Medical Student Training"¹ "The principal point that you make, and that is not generally understood, is that military services require several times as many physicians per one thousand men as are needed in civilian practice, and that these cannot be drawn off in such a way as to leave bare spots and inadequate medical care over any considerable part of the country

I think, too, that we are going to be able to save a sufficient number of those who will matriculate this fall in the medical schools to keep our student bodies reasonably intact. If the draft age is not lowered we can recruit again in 1942. We are endeavoring to see what can be done to have at least some of the medical schools go on a four-quarter basis—at least during the existing emergency."

It is not too early to stress the seriousness of the problem confronting the medical schools in view of the possibility of a lowering of the draft age, possibly to 18 years. This is at least in contemplation. And while the recent Selective Service ruling has assured the status of those men who will enter the medical schools in the fall of 1941, the prospect for 1942 is not by any means so bright. With some of the schools on a four-quarter basis for the period of the emer-

gency, students can be in school "rather than at home or elsewhere waiting to register in a medical school at the time the draft comes along." Dr. Wilbur considers that this thought needs careful discussion in our medical journals.

We, therefore, present it and urge that such of our readers as are members of the faculties of medical schools give it careful and thoughtful consideration. The suggestion raises a number of problems in school administration. It means practically continuous operation of plant and teaching staff, for one thing. Not that this is an insuperable obstacle, but it does involve considerable revision of schedules and, possibly, of finances as well—all of which takes time. For this reason it is well that discussion of the matter be commenced forthwith.

It now appears, also, according to Dr. Guy E. Snavely, executive director of the Association of American Colleges, that a major change is in contemplation in higher education which will affect between 300 and 400 colleges of liberal arts. These institutions plan to offer a three-year, as well as a four-year, academic program, beginning in the fall of 1941, to enable students to finish their academic careers before being called for military duty.

The new program is expected to keep college enrollment from dropping, since it encourages young men to complete their college work before entering upon their military training. It is estimated

REVIEWED

Surgery in Modern Warfare By Sixty-five Contributors Edited by Hamilton Bailey, F.R.C.S. Volume I. Quarto of 480 pages, illustrated. Baltimore, Williams and Wilkins Co., 1941. Cloth, \$10.

The first volume of this acutely practical and pertinent book is now on sale, the second volume will appear in a few months. These volumes are the work of sixty-five contributors who have been chosen by the editor, Mr. Bailey, as representative of British surgery. Volume I treats wounds, general and specific—wounds of the trunk, of blood vessels, nerve injuries and wounds of tendons, methods of immobilization of limbs, wounds of the hand and foot. The treatments suggested are based, in many instances, on experiences in the Spanish and the present World War, although knowledge acquired in the first World War has not been disregarded. With the division of the discussion of subjects among several contributors—as for instance, gas gangrene, treatment by x-ray, chemotherapy—a specific line of treatment may not be insisted on. This may be somewhat confusing. There are good chapters on shock, injuries of vessels, immobilization of injured limbs, and immediate and delayed operations of bowel injuries. The value of Volume I will be enhanced with the appearance of a full index in Volume II. The present status of local use of chemotherapy, Carrel-Dakin irrigation, and the closed treatment of wounds are considered with their appropriate advantages—the last word evidently not having been said. The value of such a timely book lies in the emphasis on such procedures as are indicated or necessary in action in wartime and how the indications may differ from those in civil life. The book, therefore, has a definite purpose and meets the demands made on it in a scholarly and satisfying way.

JOSEPH RAPHAEL

The Medical Clinics of North America. January, 1941. Volume 25, Number 1 (Chicago number). Octavo. Illustrated. Philadelphia, W. B. Saunders Co., 1941. (Six numbers a year). Cloth, \$16 net, paper, \$12 net.

This number of the Clinics has a practical and comprehensive symposium on pain by various specialists in Chicago. It is well worth reading.

Greene has written an extraordinarily good article on endocrine therapy in gynecologic disorders. He reviews in detail the most potent, as well as the least potent, parenteral and oral preparations now on the market. This article alone is worth the price of the book.

ANDREW M. BABEY

Surgery of the Hand. By R. M. Handfield-Jones, F.R.C.S. Octavo of 140 pages, illustrated. Baltimore, Williams & Wilkins Company, 1940. Cloth, \$4.50.

This monograph comprises 135 pages of description and numerous illustrations on the subject of the text. To one who has extensive ex-

perience, the volume will prove of interest because it covers in a thorough manner general principles, as well as details, which underlie the problem of infections of the hand.

With reference to the newer chemotherapy, the author has brought his therapy up to date by including this modality of treatment in his description. The subject matter is covered as essentially as Kanavel, but many new points of view have been added which increase the value to the practitioner as well as to the surgeon. We consider this treatise well deserving of commendation.

ROBERT F. BARBER

Macleod's Physiology in Modern Medicine Edited by Philip Bard. Ninth edition. Octavo of 1,256 pages, illustrated. St. Louis, C. V. Mosby Co., 1941. Cloth, \$10.

The new edition of this well-known work represents an important contribution to the textbooks of physiology. The text has been thoroughly revised and important additions made, so that the new edition is beyond question a most desirable text for those who wish an understanding of modern physiology. Although the book does not extend as far into the fields of clinical physiology as some others, more space is given to a clear exposition of the fundamentals. This is of the greatest importance, since the recent trend of physiologic texts to include masses of clinical information has tended to divert the preclinical student from a thorough understanding of the basic knowledge.

An important feature of the new book is the manner in which many complex relationships are summarized. This is particularly so in the section on the heart and circulation.

The section on the nervous system is recommended for those wishing a discussion of recent physiologic views. This is also true of the section on respiration. The addition of a section on water balance is particularly significant.

Professor Bard and his staff of collaborators are to be congratulated on the excellent sustained presentation of the subject of physiology.

GEORGE B. RAY

The Louse. An Account of the Lice Which Infest Man, Their Medical Importance and Control. By Patrick A. Buxton, M.A. Octavo of 115 pages, illustrated. Baltimore, Williams & Wilkins Co., 1940. Cloth, \$3.00.

National defense against the louse is an important timely matter ably presented by the director of the department of medical entomology of the London School of Hygiene and Tropical Medicine. The major portion of the book is devoted to the biology and medical importance of *Pediculus humanus*. Laboratory aspects are taken up in an appendix, while selected references are listed in a bibliography occupying $6\frac{1}{2}$ pages. The text is illustrated by numerous charts and figures. The work is authoritative and should be required reading for every physician in military service or liable to be called upon to deal with refugee groups in Europe or the Far East.

Editorial

Dr. Wilbur Comments

In a letter to the Editors, dated May 17, 1941, Dr. Ray Lyman Wilbur, president of Stanford University, says of our recent editorial, "Medical Student Training": "The principal point that you make, and that is not generally understood, is that military services require several times as many physicians per one thousand men as are needed in civilian practice, and that these cannot be drawn off in such a way as to leave bare spots and inadequate medical care over any considerable part of the country."

I think, too, that we are going to be able to save a sufficient number of those who will matriculate this fall in the medical schools to keep our student bodies reasonably intact. If the draft age is not lowered we can recruit again in 1942. We are endeavoring to see what can be done to have at least some of the medical schools go on a four-quarter basis—at least during the existing emergency."

It is not too early to stress the seriousness of the problem confronting the medical schools in view of the possibility of a lowering of the draft age, possibly to 18 years. This is at least in contemplation. And while the recent Selective Service ruling has assured the status of those men who will enter the medical schools in the fall of 1941, the prospect for 1942 is not by any means so bright. With some of the schools on a four-quarter basis for the period of the emer-

gency, students can be in school "rather than at home or elsewhere waiting to register in a medical school at the time the draft comes along." Dr. Wilbur considers that this thought needs careful discussion in our medical journals.

We, therefore, present it and urge that such of our readers as are members of the faculties of medical schools give it careful and thoughtful consideration. The suggestion raises a number of problems in school administration. It means practically continuous operation of plant and teaching staff, for one thing. Not that this is an insuperable obstacle, but it does involve considerable revision of schedules and, possibly, of finances as well—all of which takes time. For this reason it is well that discussion of the matter be commenced forthwith.

It now appears, also, according to Dr. Guy E. Snavely, executive director of the Association of American Colleges, that a major change is in contemplation in higher education which will affect between 300 and 400 colleges of liberal arts. These institutions plan to offer a three-year, as well as a four-year, academic program, beginning in the fall of 1941, to enable students to finish their academic careers before being called for military duty.

The new program is expected to keep college enrollment from dropping, since it encourages young men to complete their college work before entering upon their military training. It is estimated

¹ Editorial New York State J. Med. 41: 933 (May 1) 1941.

that a possible 300,000 to 400,000 students will avail themselves of the three-year course. The plan will provide a three-session yearly course of twelve weeks.

The new undergraduate program should work well as long as no change is made in

the present draft age of 21 years. If this is lowered to 18 years, such change will nullify the benefits to be derived. We urge medical men to give this matter serious consideration. It will, of course, be taken into account by Selective Service authorities.

Care of Gastric Ulcer in Wartime

The exigencies of war bring about strange readjustments in every phase of human existence, and the administration of medical care to the individual sufferer is not excepted. In the instance of gastric ulcer, for example, Tanner and Jens,¹ of England, call attention to the fact that the manufacturers of munitions cannot be delayed by ailments of the gastrointestinal tract, *even though the strain brought on by the war has greatly increased the incidence of gastric ulcer*. To conserve hospital beds for the victims of war, to conserve public health, and to insure the activity of a much needed worker, these physicians have conceived a modified medical treatment of peptic ulcer which has so far proved successful.

Long-standing cases of stomach ulcer which had not responded to medical treatment in the past or patients who have had relapses were subjected to immediate operation. Those who were considered suitable for medical treatment were confined to bed for two weeks and placed on a diet of soup, milk, fish, eggs, butter,

bread, jelly, and custard—a diet that was divided into six feedings daily. Olive oil and magnesium trisilicate were employed as antacids, and phenobarbital was administered to allay nervousness. The patient was forbidden to smoke. Under this regimen, with gradual additions to the diet, half of the patients were able to return to full-time work in from four to twelve weeks. Following this, the employers were instructed to give these men sufficient time off for frequent meals and lunches. Among the others who did not do well on the home treatment, it was found that family cares and the difficulties encountered in nursing and in dietetics were the principal factors acting as deterrents to medical treatment. These patients were then promptly hospitalized.

In our defense program it will become increasingly important to keep workers physically fit and to insure against the loss of workdays through illness. We have much to learn from our English confreres whose ingenuity along these lines is becoming more and more apparent.

¹ Tanner, N. C. and Jens, J. Practitioner 146: 100 (Feb.) 1941.

An Intricate Problem

We have in the past alluded to the serious menace of licensed automobile drivers who operate their machines when under the influence of alcohol. The possibility of a motor accident when an intoxicated driver is at the wheel is increased tremendously.

Cameron,¹ who has studied closely the various tests for the determination of the alcohol content in the human body, feels that the only practical ones from the legal standpoint are the blood tests. Even these, regardless of the method used, will not afford indisputable evidence that the substance estimated is in reality ethyl alcohol. Considering that the liability and possibly the liberty of a citizen may be at stake, these tests in themselves should not be deemed conclusive. "Various psychological and other

tests of behavior are in use to determine whether or not a person is intoxicated. It is generally recognized that an individual may be sufficiently under the influence of alcohol without his being intoxicated in the usual sense of that word."

The New York State Legislature has, from time to time, considered legislation dealing with this problem. The United States National Safety Congress, which reported in 1939 that a blood volume above 0.15 per cent alcohol should be considered as evidence that the driver is under the influence of alcohol, has modified its stand, so that even this organization "recommends prosecution only when the circumstances and the results of physical examination confirmed such evidence."

Zealousness should not precipitate legisla-

¹ Cameron, A. T. Canad. M. A. J. 43: 46 (1940).

tion based upon well-intentioned but unproved experiments. Cameron, after a careful survey, is of the opinion that all tests in this category cannot, at present, be rigidly interpreted as indicating alcoholism from a legal standpoint. Their use should only serve as contributory

evidence. Their main value might be said to consist in showing a complete absence of alcohol. The legislative committees of our county societies have long been studying this problem. No solution that would be just has as yet presented itself.

"March Fracture"

There will be a number of lesions and diseases hitherto considered rare or uncommon in civilian practice which will confront the civilian practitioner after the selectees have finished their period of training and have returned to mufti. One of these is the treatment or aftertreatment of so-called "march fracture." This injury is not necessarily confined to military service and it may follow ordinary athletic activity.

Moore and Bracher¹ describe it as a fracture of the second, third, or fourth metatarsal bone without any known adequate cause. Usually the first complaint is a burning sensation in the foot, occasionally sudden, disabling pain may appear at once. Within twelve hours after the onset of pain, the dorsum of the foot becomes edematous and there is a definite lump in walking. Tenderness is elicited upon pressure over the fractured bone.

¹ Moore, P. L., and Bracher, A. N. *War Med.* 1: 50 (Jan.) 1941.

The unusual point about this condition is the scanty history and the apparent absence of any etiologic factor. People walk a great deal in their normal everyday life and engage in sports both competitive and noncompetitive. Hence, the fact that an individual states that after a long hike or a tennis game he has pain and swelling in his foot might lead to an erroneous diagnosis of metatarsalgia, contusion, or trauma to the ligaments. Roentgen examination, which assures the diagnosis, might be neglected because of this.

"March foot" is merely a term for a metatarsal fracture resulting from impact between the ground and the weight of the body. Since these forces are not generally considered as external potentials for trauma, the possibility of fracture may be overlooked. Incidentally, all of the cases reported by these observers had normal arches, so that pes planus, while a possible contributing cause, is not an essential one to the incidence of "march foot."

Benzene Poisoning in Industry

The enormous increase in industrial activity to further our defense program has placed an added burden upon the medical profession to safeguard workers from the occupational diseases that hinder or totally incapacitate men whose services are urgently needed. In certain of the industries wherein benzene and its homologs are used, the number of cases of poisoning from these chemicals shows a marked increase. The effect mainly is upon the blood-forming tissues which are considerably depressed. Toluene and xylene, while injuring the hematopoietic system to a milder degree, exert a greater effect upon the nervous system.

Schwarz and Teleky¹ sought to determine the diagnostic significance of a decrease in the red and white cell estimation and hemorrhage in the detection of benzene poisoning. The blood changes differ when the different homologs are employed. Atypical clinical pictures should lead one to suspect that a mixture of

different toxic products has been used. In recent years these authors have reported that atypical cases are more frequently noted due to the increase in the use of mixed solvents. They point out the seriousness of the problem when the cumulative effects of these poisons is permitted to continue unchecked. Of 156 cases of severe poisoning, 67 resulted in fatality—a mortality rate of over 42 per cent.

Prevention and early detection of poisoning are the means with which to combat this occupational disease. The replacement of benzene and its homologs by innocuous or less dangerous solvents should be seriously considered in those industries where the employees breathe the evaporated fumes. Where benzene cannot be replaced or must be used for one reason or another, medical supervision is imperative and a monthly check-up on the blood of each worker must be made. In those manufacturing concerns using either toluene or xylene, a blood examination every four to six months will suffice to detect early changes due to poisoning.

Request to Our Authors

Who? The Committee on Publications of your Society is faced with the problem of rising costs for paper and printing. At its last meeting, it directed the Managing Editor to advise our authors of this fact and to request that our contributors reduce the wordage of their articles as far as this can be done. The Committee further directed the Managing Editor to assist in obtaining brevity by stricter editing of submitted copy.

The Editors suggest that in preparing a manuscript each author set up in the left-hand margin of the first page the five questions: Who? What? When? Where? Why? If these questions are definitely answered in the first few paragraphs of the article, in the order named, the entire subject matter will be

presented to the reader in brief outline. It may then be expanded in subsequent paragraphs to the extent that the subject necessitates.

The reason for this suggestion is clear. It facilitates editing and assures the author that nothing of importance will be omitted, since, if it becomes necessary to cut the article further for any reason, the cutting can be done from the end. Try it for yourself on this editorial. If you omit this paragraph you still know Who? What? When? Why? If you omit the second and third paragraphs you still know all the essential facts. While it is recognized that in preparing scientific papers these suggestions cannot always be carried out literally, the Editors believe that practice in arranging material in this manner will be of benefit to our authors and their readers. It will certainly be of much appreciated assistance to

The Editors

A NEW ANGLE ON TRIGEMINAL NEURALGIA

A Study of 245 Cases with Observations on Seasonal Occurrence and Surgical Technic

HENRY WARD WILLIAMS, M D , F A C S , F I C S , Rochester, New York

DURING the past seventeen years I have personally treated 245 cases of true tic douloureux. These have not been previously reported, and the following statistical account and certain facts that have been observed in the course of study are here presented. The symptomatology of the disease shall not be discussed and, since the cause of trigeminal neuralgia has not as yet been established, mention of this will also be omitted.

Trigeminal neuralgia has been known to the medical profession since Fothergill's classic description in 1773. During the past fifty years efforts to treat this disease have been progressively more successful.

The principles of treatment are simple—namely, anything that interrupts the

Who? Note that every one of the questions in the left-hand margin is answered in the first two paragraphs and the title. The entire article appeared in the June 1, 1941, issue.

What? Had an accident to the press or any other emergency destroyed the rest of the type one would still have known, in general though not in detail, who the author was, what he was writing about, where he lived, when the material was analyzed, and why it was done.

NERVOUS AND MENTAL DISEASES OF SOLDIERS DURING ACTIVE WARFARE

GEORGE A. BLAKESLEE, M D, New York City

VOLUMES have been written describing the various organic and functional diseases studied and treated during the last World War, and it is obvious that I can add only my personal experience gained in the examination and treatment of soldiers ill with nervous and mental diseases while serving in various organizations or units in the United States and in the American Expeditionary Forces.

The first opportunity for the study of a disease, epidemic cerebrospinal meningitis, occurred while working among the men training in the Eighty-first National Army Division at Camp Jackson between the months of November, 1917, and March, 1918. The epidemic assumed an alarming proportion and, although the disease stands on the borderline between general medicine and neurology, the neurologist was placed in charge, and the neurologic aspects that are only too often overlooked were carefully studied. In order to control the further spread of the epidemic, an order was issued that all soldiers who had chill, fever, headache, pain, or vomiting were to be sent without delay to the Base Hospital for observation as suspected cases of meningococcus meningitis. This undoubtedly aided in the prevention of the further spread of the disease. Nose and throat cultures were made of the soldiers with nose and throat symptoms, and hundreds of the men with positive meningococcus cultures were isolated in a distant part of the camp. Although I had treated many cases during an epidemic in New York City, the epidemic in the Eighty-first Division was most severe, and it was not unusual in the fulminant type of cases for death to come within a few hours.

Subjective Neuropsychiatric Symptoms

Photophobia.—Photophobia was often one of the earliest symptoms. Head pain more than headache occurred early, but at times spinal pain with sharp lancinating root pain occurred earlier than the head pain. Chill usually preceded the fever, headache, and vomiting. Weakness and difficulty in walking were usually present from the onset.

Read at the Annual Meeting of the Medical Society of the State of New York, Buffalo, April 30, 1941.

Neuropsychiatric Signs

Gait.—Usually there was a slow measured step.

Attitude.—The patient more often was in a jackknife position, with the arms and legs flexed and the head supported in the palm of the hand. Opisthotonos was infrequent.

Skilled Acts.—Speech was usually without tone, a monotonous slow unmodulated speech, at times inarticulate.

Abnormal Involuntary Movements.—Tremors were met with early and were mostly seen in the tongue and fingers, twitching was seen infrequently in muscles or muscle groups. Trismus was seen in only 1 case. Automatism was rarely met with in this series. General convulsions were also singularly rare. Two cases were seen in convulsions early in the disease and 4 cases later.

Reflexes.—Reflex changes were present in nearly all cases from the onset of the disease and lasted throughout its course. There may be absent superficial reflexes, with increased deep reflexes or an inequality of the deep reflexes. Frequently, in prostrated cases there may be an absence of all reflexes. The most frequent change is a hyperexcitability of both the superficial and deep reflexes. The Babinski reflex was seen but was not common.

Muscle Strength.—There was varied lessening in the degree of strength as compared with normal, except in paralysis cases. Spastic and flaccid types of paralysis were met with late in the disease.

Muscle Status.—Rarely was there marked atrophy but this was met with in flaccid paralysis in the lower extremities. Tone was tested by resistance to passive movement and extensibility of joints was usually increased. The greatest increase in tone was seen in the postcervical group of muscles, usually within twenty-four hours after the onset of the disease.

Abnormal Associated Movements.—The Kernig and Brudzinski signs were present in nearly all cases and were of early diagnostic value.

General Sensory.—Early in the disease there was a hyperesthesia to all senses. The Tendo Achilles were especially tender to pressure early in the disease.

Cranial Nerves—Olfactory nerves were not tested. Optic, oculomotor, and abducens nerves and optic apparatus vision were rarely impaired except in panophthalmitis, and then there was total loss of vision in the eye involved.

Fundus—Fundus changes were present in nearly all of the cases. The retinal vessels were dilated and engorged with a resulting retinal hyperemia. Usually on the third or fourth day of the disease in about 20 per cent of the cases there was a haziness of the disk outline. Also at this time there may be a few small retinal hemorrhages. The fundus changes may be of unequal intensity in one eye as compared with the other. At the end of a week and during convalescence the fundus becomes nearly normal in its appearance.

Pupils—Early in the disease, the pupils were moderately or widely dilated from 4 to 6 mm in diameter and equal. In a few cases the diameter was 3 mm or less. Infrequently, contracted pupils were seen. An irregularity in the shape of the pupils was rarely seen. During the course of the disease and until convalescence, the pupils were frequently unequal and often changed in size daily. The pupillary reaction to light was somewhat sluggish in about 50 per cent of the cases. Convergence was less frequently impaired. Extrinsic eye muscle paralysis was not common and nystagmus was not frequently seen.

Acoustic Nerve and Ear—Hearing was often impaired in one or both ears. Slight or total deafness may develop early, but more often it was met with later on in the disease. Normal hearing returned usually in about two or three weeks.

Trigeminal Nerve—Involvement of the fifth motor nerve was rare in this series, two cases were seen.

Facial Nerve Paralysis—Facial nerve paralysis usually occurred after the fifth day and in most of the cases was of gradual onset. It was of the peripheral type and persisted for several weeks.

Glossopharyngeal and Vagus Nerves—No glossopharyngeal paralysis was seen. Respiratory paralysis was seen late in the disease. All of the cases succumbed suddenly to this condition.

Spinal Accessory Nerve—Torticollis or forced position of the head to the right or left was frequently seen. It was seldom met with before the sixth or seventh day. It is questionable how many of these cases were due to involvement of the spinal accessory

Probably most of the cases were caused by unequal hypertonicity of the postcervical muscles on the left or right side.

Hypoglossus Nerve—No hypoglossal change was seen.

Psychiatric Signs

Lethargy was common. The patient often fell asleep during the examination but could be aroused by loud talking or other impressions.

Coma was less frequent and the patient could not be aroused.

Delirium was present in about the same number of cases as coma, there was disorientation, incoherent flight of ideas, fears, and much physical activity.

Mental confusion was still more infrequent. There was no mental change in about one-third of the cases.

General Systemic

Skin rash occurred early and was one of the common symptoms of meningitis. The rash usually appeared as early as the second day of the disease and came in crops. It began to fade in twenty-four hours and usually disappeared within seventy-two hours. Exceptions were the large purpurae with accumulation of blood beneath the superficial skin which resembled blood blisters. These disappeared after a long period.

Herpes was a frequent symptom, usually occurred on the third or fourth day, and was not preceded by pain. On the face they were most frequently bilateral in location. The herpes usually disappeared in about two weeks.

Vasomotor and Secretory—Vasomotor changes were met with early in the disease. The countenance sometimes showed a dusky, ashen appearance. Occasionally, there was a diffuse cyanosis over the entire body. During convalescence the skin usually assumed a pink appearance and there was rarely a cachexia. Early and through to the termination of the disease the skin was dry.

Skin Reactions—Dermographia was present early, usually showed promptly, and was of fairly long duration. Gangrene was extremely rare and occurred late in the disease. One case was seen in which the toes of both feet were gangrenous.

Neuropsychiatric Types

In this series the types of cases met with in the order of their frequency were (1) dull and retarded, (2) fulminated, (3) pros-

trated, (4) overactive, (5) convulsive, and (6) mentally clear and alert

The *sequelae* were (1) contractures and paralyzes in the lower extremities, (2) inequality of the reflexes, (3) arthritis, (4) deafness, (5) panophthalmitis with loss of vision, (6) chronic hydrocephalus, (7) endocarditis and pericarditis, (8) bilateral gangrene of the toes, and (9) slight memory defects

General Course—The duration of the disease in this series averaged about four weeks. At the end of this period, usually the men were out of bed and at the end of six weeks were usually returned to their command for light duty

Treatment—Frequent spinal fluid drainage and antimeningococcus serum was given intraspinally and intravenously

Actual Combat

From Camp Jackson I was ordered to report to the Senior Consultant in Neuropsychiatry of the American Expeditionary Forces and was then assigned to a Combat Division. Upon presenting my orders to the Acting Division Surgeon, I had an interesting experience. The first information he desired was whether he outranked the psychiatrist. We held the rank of major. Upon learning that he did, by about two weeks, we got along very happily until hostilities ceased. Although I was assigned to work in the Field Hospital, it quickly became apparent that my work was too restricted and that more aid could be rendered, especially in the prevention of nervous and mental diseases, if I were permitted to circulate in the Division. The Division Surgeon supported this view and with no mental reservations. The greatest aid was given, and on several occasions the commanding general requested that I report to headquarters. I was told to visit the advanced firing lines and interview the officers, sit at their mess, observe their conduct and behavior, and report to the commanding general, mouth to ear and dispense with paper work. This surely was the height of cooperation when one considers the interest and concern the commanding general of the Division had in the nervous and mental status of the officers who were responsible for executing his commands during combat. Of equal, if not of greater, importance was the frequent contact with the company officers and top sergeants. Any change in their conduct or behavior was quickly noted. If an efficient soldier was observed to become careless, less alert, inattentive, inefficient and seemed

to be less interested in his duties, he was sent to the Field Hospital, which was usually a few kilometers in the rear of the combat forces. These soldiers were the potential or preneurotic group. Usually the change from active duty and responsibility to the more quiet environment of the Field Hospital was of great aid in their becoming less tense and securing a more relaxed mental state. Mental therapy was given daily. First, they were told that they had not been physically injured and that their body was healthy. They were kindly treated and not reprimanded. They were encouraged to eat and sleep well and were frequently given a mild sedative to enable them to secure a good sleep. Their patriotism was appealed to, and this was supported by the fact that the Division was advancing, the enemy was retreating, and the war would soon be over.

Nearly all of these soldiers were returned to their companies and, of utmost importance, the fighting strength of the Division was thereby maintained. The soldier was also told that he was in the Field Hospital attached to his Division, that as the Division moved forward, the Field Hospital moved with it, and that he could not possibly be sent to the rear. This undoubtedly was of much therapeutic value as an aid in persuading him to return to duty. Probably the most important factor in the favorable results obtained was that the soldier had not as yet developed a real neurosis but might be called a potential neurotic.

Exhaustion—Many soldiers were ill with exhaustion or fatigue. They were excellent soldiers and anxious to carry on with the responsibilities and duties assigned to them, but they were extremely fatigued. Usually, they had experienced many of the hardships and horrors of the war. Frequently, they had too little sleep, gastric distress or diarrhea, generalized weakness, poor appetite, and loss of weight. These soldiers were on the verge of a neurosis or psychosis, and I made every effort to have them sent to the Field Hospital for treatment. It was explained to them that they were overtired and exhausted and would soon be back to their companies. They were given rest, plenty of food, and moderate exercise. Occasionally, a mild sedative was administered to induce sleep. On one occasion during the height of combat when the Field Hospital was overtaxed, about 200 of these soldiers were sent by trucks to Neurological Hospital No. 3, a few miles to the

rear of the Field Hospital, and there they received care and treatment. None of these cases were sent to the rear. Nearly all of these soldiers were returned in good health to the Division in one or two weeks but, if they had not been so treated, undoubtedly they would have gone on to a neurosis or psychosis.

Hysteria—The largest number of the war neuroses that I treated while serving with the Division were the hysterics. The opportunity of studying hysteria—with its various manifestations, almost immediately following the onset of signs and symptoms—and the privilege of keeping the men under daily intensive treatment were to me the most unusual and satisfying experiences during the World War. The most common causes of hysteria during actual combat were psychoemotional shocks, minor physical injuries, and postconcussional reactions following the explosion of large shells and bombs. Hysterical amnesia was most frequently observed.

At times the soldier was mute and neither spoke nor uttered sounds. He remained silent and appeared dull and confused. Usually, he would follow commands or requests but was greatly inhibited.

Motor and sensory conversion signs and symptoms were common. *Astasia-abasia* was frequently seen and may be experienced suddenly by the soldier. As an example, a soldier went over the top with his company, and his close friend and buddy beside him was seriously injured and left on the field as his company went forward. He remained with the soldier a few minutes, removed from his buddy's wrist a watch, a present from his mother, and then again started to go forward. He could neither stand nor walk but crept forward, an illustration of an *astasia-abasia*, surely there was no cowardice there.

Hysterical monoplegias and hemiplegias, blindness and deafness, and sensory conversion experiences were common.

Another group with abnormal involuntary movements—such as tremors at rest and, on intention, muscle group choreiform movements, torticollis, and tics—was seen. These soldiers were treated in the Field Hospital. Nearly all the soldiers suffering from hysteria were returned to their units with the Division following treatment, with an explanation of the cause of their symptoms, suggestions were given, and an electric current from a French faradic battery was often applied to the affected parts of their bodies. Probably the most reasonable explanation of the short

duration of the neurosis and the soldier's return to duty was that the neurosis was of very short duration and had not become well fixed, and treatment had been quickly begun.

Anxiety Neurosis—This neurosis was common and was probably experienced in a greater percentage of officers. It was this type of neurosis with which I came in contact when the commanding general ordered me to visit the advanced lines of the Division and to interview the officers and observe their conduct and behavior. It was when the soldier was in the anxiety state that cases were seen and frequently were diagnosed as effort syndrome.

The soldier ill with an anxiety neurosis was worn with fatigue, complained of an inability to sleep well, and dreamed much. Usually, he had a poor appetite and lost weight. He was restless and in a state of anxiety and was frequently alarmed because of his condition, which was difficult for him to understand. He became jittery and often melancholy. Frequently, he was on duty at night, watching and directing the flares. After the psychiatrist had talked with him and advised his leaving his unit and going to the Field Hospital for a short rest, he usually would not consent to go. Frequently, it was necessary to have him relieved from duty. Mental therapy, rest, and mild sedatives to induce sleep were used, but the percentage of soldiers returned to duty following treatment in the Field Hospital was not high. It was usually necessary to send the soldier to a neurologic hospital for treatment.

Gas Poisoning and Neurosis—Officers were trained in the diagnosis and treatment of gas poisoning, and a gas officer was attached to each division. The soldiers were alert and on the lookout for attacks with gas waves by the enemy. Phosgene and mustard gases were used and the phosgene gas was the more deadly. I was ordered to the triage or sorting station after a gas alarm was given because, frequently, the soldier complained of irritation or a burning sensation in the nose, throat, and eyes. Other complaints were a husky voice, heaviness or pain in the thorax, with slight difficulty in breathing.

The gas officer and I examined each soldier who complained of symptoms, and a differential diagnosis was made between gas poisoning and a hysteria or neurosis. Many of the soldiers suffered from hysteria.

Postconcussion Syndrome—Soldiers rendered unconscious following the explosion of a large shell or bomb and who regained con-

sciousness in a short time usually remained in the Field Hospital for treatment

There usually was no evidence of external trauma, but occasionally pieces of shrapnel caused ragged lacerated wounds in any part of the body. X-rays of the skull or spinal fluid examinations were not done in the Field Hospital. After the soldier regained consciousness there frequently was loss of memory, confusion, headache, dizziness, and a sensation of fullness in the ears or tinnitus, and deafness was experienced

These cases should be considered ill with an organic disease. Many cases were returned to their unit in the Division from the Field Hospital, while others were sent to a neurologic hospital. Other soldiers were admitted to the Field Hospital stating that shells had exploded in close proximity to them, but they had not been rendered unconscious or thrown to the ground or against objects. They complained of vertigo, impaired vision or hearing, and most often a tremor or shaking of the body. They were treated in the Field Hospital, assured that there was no bodily injury, and told that their symptoms were caused by fright, with resultant nervous and emotional disturbances that would quickly disappear, and that they could and must quickly return to their companies in the Division. They were the war neuroses or hysterias so frequently confused with the postconcussional cases following cerebral commotion

Psychoses and Posttraumatic Neurologic Disease—The number of soldiers ill with psychoses was few as compared with the war neuroses. Many were of the manic-depressive type. The hypomanics and depressions were more frequently seen than the agitated form. The schizophrenic types of mental diseases were even less frequently observed. These cases were not held in the Field Hospital but were immediately evacuated from the front

Compound and comminuted skull fractures, with severe brain lacerations and resultant mental symptoms and organic neurologic signs, were seen in consultation with the surgeons and sent to the Evacuation Hospital. The spinal cord and peripheral nerve injuries also were immediately evacuated following first-aid care

One case was diagnosed as catatoniac dementia praecox. The soldier was stuporous but could be aroused, and he answered questions intelligently. There was rigidity of the muscles, and the extremities sustained various positions in which they were placed without

aid or support. There was a low-grade temperature. The soldier died in a few days and an autopsy was performed. The pathologic findings were those of encephalitis lethargica. This was the first case of epidemic encephalitis I had ever seen

Another soldier was examined who complained of weakness in the lower extremities with associated numbness and tingling in the toes and feet. Within forty-eight hours he had a paraplegia and stocking anesthesia in the lower extremities. The upper extremities were soon similarly affected. There was a loss of the deep reflexes in both the upper and lower extremities. He died in a few days. I performed an autopsy and the spinal cord was removed. Dr. Louis Casamajor made the pathologic study. The diagnosis was acute infectious multiple neuritis, Guillain-Barré syndrome

After the War

After the armistice was signed I was ordered to Germany to serve with the American Army of Occupation, and for the first time during the World War I had the opportunity to work in a modern, well-equipped hospital. The neuropsychiatric service was quite an active one, but the type of reaction in the psychoneuroses was different. Nearly all of the psychoneuroses were depressed and melancholy, they were ill with nostalgia. The soldiers realized that the war was over and were anxious to return to the United States. The hospital was located one block from the depot, and hospital trains arrived twice a week to take the ill soldiers to ports of debarkation. This added to the difficulty in successful treatment of these cases in Germany, and an endeavor was made to send them to the United States as soon as possible. Because of the privilege of visiting the cities and towns in Germany, many soldiers were treated for acute alcoholism, and one soldier, in whom there was optic nerve atrophy with associated loss of vision, was seriously ill with wood alcohol poisoning. Two cases were diagnosed as paralysis agitans type of epidemic encephalitis and had complained of the symptoms for months. This is of interest when one realizes that these soldiers served during active combat. One case, diagnosed as cerebellar brain tumor, was sent to a base hospital in France because no brain surgeon was assigned to the American Army of Occupation. Cerebral vascular lesions with hemiplegia, central nervous system syphilis, and many cases of Bell's palsies were treated. One case of myotonia congenita was

seen, and it is surely much to the credit of this soldier that he carried on throughout the duration of the war

After I received orders to return to the United States via Brest, it was necessary, in order to secure passage on a vessel, to take charge of a group of neuropsychiatric cases and take them to Army Hospital No 1 in New York City. Again, the type of case was quite different from any seen during actual warfare. There were 24 cases in the group and they had been diagnosed, before sailing, as syphilophobia and homosexuals

Conclusion

It may be stated that probably none of the soldiers was ill with diseases that are not seen in civil practice, with the exception of the phosgene and mustard gas poisoning. There was this difference, however. Soldiers lived under the strictest discipline and were always under severe command, the environment was so unusual and the sights so horrible that nearly all of the diseases had what might be called a distinct war coloring. I feel that my most interesting experience was with the Division during actual combat.

Army regulations assign one division psychiatrist to a division, usually numbering between 20,000 and 30,000 men. It is impossible for one psychiatrist to do efficient neuropsychiatric work and particularly so when the division is in action. One or more assistant division psychiatrists and a well-trained neurologist should be permanently assigned to a division so that preventive neuropsychiatry could be more thoroughly and efficiently established and the soldier more thoroughly cared for during his illness.

Discussion

Dr Frederick C Robbins, *Canandaigua, New York*—I would like to continue the story of the psychotic individuals from the time that Dr Blakeslee left.

He and I were closely associated at Camp Jackson and also in the Army of Occupation. Unlike him, I continued in the service, being commissioned in the United States Public Health Service up until October, 1940, when they transferred their patients to the Veterans Administration. When the A.E.F. transferred all their psychotic patients to the United States, they were first sent to Fort Sam Houston, Texas, and to other general hospitals throughout the country. The numbers became increasingly larger, and the United States Public Health Service took this work over and established hospitals all over the United States.

Many of the psychoneurotic patients re-

covered and were sent home, leaving the patients that had developed and were developing into the dementia praecox type. The manics soon recovered and also were sent home. As the years have gone by the types of diagnoses have markedly changed. There are present, in the twenty-seven hospitals in the Veterans Administration devoted exclusively to neuropsychiatric disorders, practically 60 per cent of dementia praecox patients and 25 per cent of neurosyphilis patients, the remaining cases being classified as psychoneurotics, alcoholics, psychopaths, and mental defectives with psychosis.

The cost of hospitalization of these cases in a thousand-bed hospital is approximately \$400,000 a year. Multiplying this by twenty-seven will give a little idea as to the cost per year for the care of these cases, many of which could have been eliminated by the Draft Boards.

Within the past week I have gone over this matter with Miss Katharine Ecob of the Mental Hygiene Division of the Charities Aid Association, and the lack of cooperation and coordination between the psychiatrist of the advisory group and the physicians on the Draft Board is appalling. It would be fairly easy to eliminate the mental defectives if just two questions were asked. First "In what grade were you when you left school?" Second "How old were you when you left school?" If these questions were asked, practically all the persons who had been unable to progress in school could be examined for mental deficiency.

In many of the counties the Draft Boards are referring practically none of the men to the advisory psychiatrist, and in some counties there is no psychiatrist available.

It would seem to me that there should be some effort made by this Society to assist in this tremendous problem, and there must be enough civilian psychiatrists who would be willing to cooperate in this matter.

The week before last I visited a prominent camp on the eastern sea board, and in looking over the selectives I asked who was the division psychiatrist. I was told that there was none at that camp but that there were two young psychiatrists at the Base Hospital who had not had much experience in psychiatry.

It seems to me that, while the Draft Boards are at fault, there must be "something wrong in Rome" that there was not available at least a division psychiatrist of experience in the camp that I visited to direct the examinations of the mentally misfits.

I agree with Dr Chambers that this section go on record as recommending some procedure whereby the different counties may be visited by a member of a Board in the view of bringing together the advisory psychiatrist and the Draft Board.

Dr Henry W Miller, *Brewster, New York*—This contribution is timely. I agree heartily.

with the suggestion that he has made. I feel that the importance of the neuropsychiatric problem has not been sufficiently emphasized.

We were informed yesterday by Dr Foster Kennedy that since the last World War each neuropsychiatric soldier has cost us \$30,000

We are soon to have an army of 4,000,000 men. Has not the experience of the former war taught us that every effort should be made to prevent our making a repetition of our mistakes in that war?

I feel that this section should like some action to coordinate the neuropsychiatric activities

DRAFTING THE MENTALLY UNFIT

Inadequate, hasty, and slipshod psychiatric examinations of Selective Service men are permitting many mentally abnormal persons to enter the army, doctors announced after a meeting of psychiatrists connected with medical advisory and army induction boards, as reported in the *Elmira News*. The meeting was held at The Academy of Medicine in New York City.

Doctors told of men unmistakably mentally unfit being taken into the army over psychiatrists' objections. They said that men with mental ages of 7 and 8 years have been accepted when the minimum mental age acceptable is supposed to be 10. One doctor reported that erasures were made on his recommendations by army officers at an induction center.

Complete disregard of Selective Service provisions for psychologic examinations was reported by the doctors. In some centers 150 to 170 men a day are examined, which allows about one and a half minutes per man. The doctors estimated that at least fifteen minutes are required for a satisfactory psychiatric examination.

There should be at least one psychiatrist for each fifty drafted men examined in a day, according to Selective Service standards, said Dr Harry Stack Sullivan, Selective Service consultant on psychiatry.

Each mentally defective case admitted will cost the government eventually \$30,000, and more than a billion dollars has been spent since the World War on the mental cases wrongly admitted into the service, Dr Martin Cooley of the Veterans Administration said.

"But do not psychopaths make good soldiers?" one doctor asked from the floor. "Should we not take them into the Army? Some of the greatest military men have been undoubtedly psychopathic and some people say the whole business of war is psychopathic. Why hurt the Army?"

"Unquestionably psychopaths and morons make very good soldiers," Lieutenant Colonel P S Madigan, of the Medical Corps, the principal morning speaker, said in reply. "There is no question that high-grade morons get on very well in the Army." Experience has shown, however, that it is impossible to detect what types would be satisfactory, Colonel Madigan continued.

Dr Sullivan in the afternoon added that the British have found that paranoid types, which manifest extreme hostilities, make good soldiers but constitute the single largest cause of disciplinary trouble in the ranks.

"We are not sorting out the insane, the nuts, the whackies, the queer eggs," Dr Sullivan said. "We are sorting in the people who are peculiarly fit for the military vocation, which is a relatively small segment of the population."

"Under present circumstances we are very definitely trying to see how many we can keep out," Dr Karl M Bowman, director of the psychiatric division of Bellevue Hospital, said. "We should look upon these examinations as vocational aptitude tests."

To avoid the stigma which might attach to rejection for mental deficiency, Dr Bowman recommended that physicians be allowed to reject men because of "lack of military aptitude." This, he said, would not handicap them in civilian life, where they might be important cogs in the defense machinery.

At least 5 per cent and preferably 10 per cent of all the drafted men should be referred by the local boards to psychiatrists, both Dr Sullivan and Dr Bowman contended. If this is not being done the local boards are failing in their function, they said.

One doctor related that a local board had passed a number of men whom he recognized as former mental cases of his, and he had to step in and reject them, although they had not been referred to him.

"The local board doctors are not aware of the significance and interpretation of some of the behavior they observe sometimes," commented Dr Howard W Potter, professor of clinical psychiatry at Columbia University and chairman of the afternoon session.

Several speakers alluded to the severe strain imposed by modern war and said it was shared equally by almost all branches, so that mental defectives could not safely be put in special services, such as the hospital or quartermaster corps.

"The terrible conditions of modern warfare have contributed to the creation of a disease entity, 'war neurosis,' a condition very similar to the neuroses of civil life, but highly colored by the terrifying influences," Colonel Madigan said. More than 8,000 neuropsychiatric cases were returned from France in the last war, he said.

All symptoms such as sluggishness, discontent, loneliness, nostalgia, depression, shyness, dullness, and stupidity in drafted men should be watched closely, he said. Eccentric individuals do not fit into the Army, but may do well in a civilian branch of defense, he added.

—J.A.M.A.

A NEW TREATMENT FOR HAY FEVER

ERNEST J. ELSBACH, M D , New York City

ALLERGIC rhinitis, which is quite common in this country, causes a tremendous loss of working hours because of the discomfort caused by the disease and by the eventual reaction to the usually applied specific treatment, which takes a long time and is expensive.

Therefore, we have to endeavor to find better remedies for this condition. That the hitherto-known remedies are not satisfactory is evidenced from the fact that new kinds of treatment are recommended nearly every day. A remedy for this disease should make the treatment as simple as possible, i e., it should not require complicated tests, should have a minimum of eventual reactions and, finally, should require less time for treatment.

In Europe, where allergic rhinitis is not as common as in the United States, such a treatment is used with excellent results. To my knowledge it so far surpasses the specific treatment that I feel this form of treatment should be put at the disposal of the profession here for the benefit of sufferers of hay fever. Before doing so it was, of course, necessary to find out whether this remedy might have the same success here since there are many more agents causing allergic rhinitis in the United States than there are in Europe. Therefore, I have, by permission of Dr. James W. Babcock, treated several of our clinic patients, especially during the hay-fever season—a time when specific treatment is not applied because of the known reasons—with this remedy and have had parallel excellent results. Because conditions are different all over the United States, physicians in different parts of the country had this remedy at their disposal and reported the same good success.

Undoubtedly, some pathologic conditions of the vegetative nervous system are predisposing factors for allergic rhinitis. The precipitating factors are varied and many and include grass pollens, food allergens, and other irritants, including the too strong radiation of ultraviolet and natural sunlight. Inflammation of the abdomen may also precipitate such attacks, as well as psychic factors such as fright, fear, anxiety, etc., because of the involvement of the vegetative nervous system.

From Otolaryngological Service of Vanderbilt Clinic,
New York City, Chief Dr. James W. Babcock

The treatment hitherto usually employed is to determine, in the free interval, which allergen is at fault. This procedure is laborious for the physician and tedious for the patient. Frequently, it is difficult, if not impossible, to detect the principal allergen in substances like dust, hair, flour, etc. Finally, there are individuals who react to any number of irritants.

Investigations have disclosed that in every infectious disorder of the body the curative effect is exerted by influence of the nervous system on the endothelial system. The principal remedies that stimulate the former to resist infections are autohemotherapy, protein bodies of various kinds, and albuminous substances.

Allergic rhinitis is often caused by the pollen albumin of blooming grasses and flowers and the albumin of foodstuffs. Therefore, protein therapy in correct dosage may be successful in some such cases. It is known that attacks of allergic rhinitis may be prevented by a suitable diet, free from salt and spices. Elimination of disease of the abdominal organs or of intestinal stasis may have the same effect. Calcium and strontium preparations have also been used to diminish the irritation of the sympathetic nervous system.

A new biologic treatment is now presented which appears to act to a high degree as a stimulant to the natural functions of the sympathetic system to render it foolproof so that it no longer reacts to any irritant. It consists of the products of the metabolism of *Bacillus coli* found in the human intestines and grown on specific culture mediums. The pure cultures are incubated at body temperature, transplanted and, after heat killing the bacilli, diluted with physiologic salt solution. After aseptic filtration these metabolins in the clear liquid are used therapeutically.

The action of this natural metabolic product is by no means a nonspecific protoplasm activation, because its effect is the same even when the preparation is deproteinized by heating. Its action on the sympathetic nervous system seems to be pronounced and to have a desensitizing effect.

The treatment consists of eight to twelve intramuscular injections of 2 cc. each of "Coli Metabolin Tosse." The first five injections

should be administered within five days. The balance may be given with intervals of one day.

The advantages of this method are clearly visible. Treatment before the onset of hay fever is not necessary but should be started when the first symptoms appear. A marked improvement is usually seen after two or three injections. All the tests to find out by which allergen the complaints are caused are unnecessary. Furthermore, the treatment takes only two to three weeks and, thus, is more convenient for the patients, particularly because no maintenance doses are required during the rest of the year. I have not seen one unfavorable reaction, but I find some that soon disappeared in 6 cases (8 per cent) reported by physicians all over the country. They consisted of local inflammation, increased sneezing attacks, slightly raised temperature or, in 1 case, diarrhea. Naturally, it is hard to say whether the injections are to blame for these reactions. Only 2 patients with these reactions refused further treatment, but 1 was cured although he had received only one injection.

The youngest of our patients was 9 and the oldest was 56, they were of different professions and sex. Of the 75 patients treated with Coli Metabolin Tosse we saw no result after six injections in 1 case, 1.3 per cent, cured, 53 cases, 70.7 per cent, and improved, 21 cases, 28 per cent. The average doses in cured cases were seven and two-tenths, in improved cases, nine and one-half injections.

The results in some cases were striking when

patients who had suffered from sneezing, running nose, conjunctivitis, etc., for a long time noticed a great improvement after the first two or three injections. We treated patients not only with acute hay fever but also those who had been suffering all the year round with the same success.

I know it would be more satisfying to report about these results after observation of the patients over a longer period of time. But, on the one hand, I think this remedy is so harmless and brings such quick relief that it should be in the hands of the profession as soon as possible. On the other hand, I believe the patient will not object to repeating a few injections if his complaints should recur, since they take so little time and need not be repeated during the rest of the year.

Permit me to add that Coli Metabolin Tosse has also shown good results in allergic asthma and allergic eczema, in the latter case combined with strontium bromide.

Summary

The good results of treatment of allergic rhinitis with Coli Metabolin Tosse* are described. Its advantages are (1) Tests to find out which allergen is at fault are not necessary. (2) Coseasonal treatment, as soon as complaints have started, is possible. (3) Only eight to twelve intramuscular injections are needed. (4) No maintenance doses are required. (5) Hardly any reactions are provoked.

20 East 87th Street

* Coli Metabolin was supplied by Tosse Laboratories.

DOCTOR'S TELEPHONE WHILE ON MILITARY DUTY

A "generous and patriotic gesture," as the *New York Medical Week* remarks, has been made by the Doctors Telephone Service and the New York Telephone Company for the benefit of doctors who enter military duty. It is told in a letter to the *Medical Week* by Sherman C. Amsden, managing director of the Doctors Telephone Service, as follows:

"What happens to the telephone number and the telephone calls of physicians and surgeons who accept commissions in the Army and Navy and leave for active duty?

"This subject was taken up with the New York Telephone Company by Doctors Telephone Service. For the benefit of those doctors who wish to cancel their telephone during their absence but at the same time would like to retain their numbers pending their return to civilian practice, the following official ruling has been received:

"(1) During a doctor's absence he can continue a listing in the Manhattan Directory, making use of one of the Doctors Telephone Service

telephone numbers and addresses, or the number and address of a colleague. The cost for this listing will be 25 cents per month. All telephone calls directed to the doctor's old number will be transferred to our number, or that of a colleague. The doctor's old telephone number will be held in reserve and calls continuously transferred until the doctor returns from service to take up practice again.

"(2) If no listing in the directory is desired, the doctor's old number will still be reserved during his absence and calls continually transferred to a colleague or to Doctors Telephone Service at no cost.

"As our contribution to the defense effort, we offer to any doctor in Manhattan who enters active service the following service, without charge:

"We will accept all calls transferred from the doctor's own number to ours and dispatch these calls in any manner the doctor may direct, keeping a report that he may review upon his return."

Diagnosis

CLINICOPATHOLOGICAL CONFERENCES

FOURTH MEDICAL DIVISION OF BELLEVUE HOSPITAL

History

This was the first admission of a 45-year-old white man for severe pain in the lumbar back and the abdomen of two hours' duration. The family history was negative. The past history was negative except for a proved coronary thrombosis preceded by several anginal attacks two years previously. Since that time the patient had been on restricted activity and had been free from any severe anginal seizures. The patient had had hypertension for several years. The present illness began on the morning of admission, when, while straining at stool, he suddenly experienced a knifelike sharp pain in the lumbar region radiating down and around to both groins. It became duller in character but was followed shortly by a severe abdominal pain maximal in the left lower quadrant. The patient vomited once and broke out into a profuse perspiration of the upper half of the body. The abdominal pain persisted for two hours preceding entry to the hospital and was accompanied by a duller pain in the substernal region which did not radiate to the arms or shoulders. There had been no previous genitourinary or gastrointestinal symptomatology, and venereal disease was denied.

On admission the patient was a well-developed and well-nourished white man in acute circulatory collapse, moaning with pain. The skin was cold and clammy, the pulse was slow and regular and of good strength. His temperature was 97.6 F, pulse, 60, respirations, 22, and blood pressure, 120/90. The lips were of grayish color. The head, eyes, ears, nose, and mouth showed no abnormalities. The heart was moderately enlarged to the left on percussion, heart sounds were of poor quality with regular rhythm. There were no rubs or murmurs heard. A_2 was greater than P_2 . The lungs were clear to auscultation and percussion. There was present slight precordial hyperesthesia. The abdomen had marked hyperesthesia and was held rigidly splinted everywhere, but mostly in the left lower and left upper quadrants. There was marked tenderness everywhere, greatest in the left lower

quadrant. There was no rebound tenderness. The genitalia were that of a normal man. The rectal examination revealed the prostate to be soft and of normal size, and no masses or tenderness was present. The extremities showed no clubbing or peripheral edema. There were psoriasisiform lesions of both elbows. Both dorsalis pedes were easily palpable.

On admission the white blood count was 18,400 with 88 per cent polymorphonuclears. On bed rest and heavy sedation, the patient's pulse, temperature, and blood pressure slowly rose in the next twenty-four hours, after which time the patient was definitely no longer in shock. It was felt by the surgical staff that the patient was probably not a surgical case at first, and he was transferred to the medical service for observation. However, after a day on the medical ward, during which time the abdominal signs persisted, one of the surgical consultants palpated a soft mass in the right lower quadrant which made him believe that some kind of abdominal apoplexy was present and that the patient should be sent back to the surgical ward for closer (surgical) observation. An emergency roentgenogram of the chest revealed an unusual prominence of the shadow along the right border of the heart, and it was observed at this time that the blood pressure differed in the two arms—180/120 on the right and 220/150 on the left. The leukocytosis persisted. On the night of the second twenty-four hours in the hospital, the pulse, which up to that time had been slow, suddenly rose to 130 and remained above 100 during the duration of the illness. The red blood count on the second day was 4,300,000 and on the third day it had dropped to 2,890,000. A stool specimen on the fourth day showed a 4 plus benzidine reaction. While on the surgical service, the patient continued to feel better, the pain continued but had changed in character to a steady dull aching in the back and in the substernal region. He was given supportive measures consisting of daily infusions. The abdominal rigidity and tenderness persisted. On the evening of the fifth day he was observed to have signs of pulmonary edema at the right

June 15, 1941]

base, and on the sixth hospital day he died in acute pulmonary edema.

The laboratory findings were as follows. The white blood count ranged between 18,000 and 20,000 with 83 to 90 per cent polymorphonuclears during the first four days, then fell slowly to 8,800 with 86 per cent polymorphonuclears on the day of death. The red blood count fell as described and on the sixth day was 3,000,000. The urinalysis showed a specific gravity of 1.015, and the only positive finding was a 3 plus albumin. The blood Wassermann was negative, the blood non-protein nitrogen was 47. The electrocardiogram on the day of admission showed sea gull T_1 and T_4 and a notched QRS in lead III, sinus rhythm. Another electrocardiogram taken on the fourth hospital day showed P_1 , P_2 , and P_4 upright, T_2 inverted, notched QRS, sinus tachycardia. This electrocardiogram was interpreted as suggesting active acute small infarction. A flat plate of the abdomen, taken in both the prone and erect positions, was interpreted as negative. A roentgenogram of the chest revealed a marked dilatation and prominence of the ascending aorta.

Discussion

DR ARTHUR L. WASHBURN. The outstanding feature of this case was the lumbar pain, which was knifelike and catastrophic, radiated down and around to both groins, and was experienced suddenly while straining at stool. This pain, of such sudden onset, combined with a strikingly lower blood pressure in the right arm, immediately called our attention to the possibility of a dissecting aneurysm with pressure on the innominate artery when this case was transferred by the surgeons to a medical ward. At this time an emergency chest plate revealed an unusual prominence of the shadow along the right cardiac border. The subsequent course, however, caused the case to be transferred back to a surgical ward for closer observation, and it brought up for consideration other possibilities such as mesenteric thrombosis (vascular occlusion), acute pancreatitis, acute perforated duodenal ulcer, and coronary occlusion simulating an acute abdomen.

Of 157 cases of acute mesenteric thrombosis reported by Jackson, Porter, and Quinby, 51 per cent had generalized abdominal pain, 41 per cent had pain referred indiscriminately to every classic area of the abdomen, and none had pain referred to the back. The pain of acute perforated duodenal ulcer can

be sudden and severe and can strike first in unusual areas, including one shoulder. But it rarely, if ever, is referred first to the back and, when as overwhelming as in this case, is soon followed by boardlike rigidity of the abdomen and persistent vomiting. Only the pain of ultra-acute cases of pancreatitis would be comparable to the pain in this case, again the pain is abdominal and is rarely, if ever, referred primarily to the back, and persistent vomiting with a merciless progression into frank peritonitis is the rule in the severe cases. Alexander Lambert called attention to the rare types of pain in coronary thrombosis, including lower abdominal pain radiating down both legs, but more especially to the much more common cases of coronary occlusion simulating acute surgical abdomen. He says "Small wonder that these patients have been operated on for gallstone colic, or more often acute perforating duodenal ulcer, or acute pancreatitis." The next most important feature in the case was the course. The patient was admitted in acute circulatory collapse, following which his blood pressure slowly rose until he was definitely out of shock within twenty-four hours. Within forty-eight hours his blood pressure had risen from 120/90 to 220/150. At this point, the pulse, which had been 60 on admission and had remained slow, suddenly rose to 130, and overnight there was a sharp drop in hemoglobin and red cells. Although rigid splinting of the abdomen had been reported on admission, the patient was able to relax his abdomen when on the medical ward, and there was no rebound tenderness and no vomiting. While on the surgical service, although the white blood count and polymorphonuclear cells remained elevated, the abdomen failed to give evidence of frank peritonitis, and the patient continued to feel better. Marked generalized tenderness with moderate spasm, present since admission, persisted, and one of the surgical consultants palpated a soft mass in the right lower quadrant. Opinion differed as to the areas of most marked tenderness. At this time, since obstipation had been present, a small enema was given in a search for blood. This yielded no evidence of macroscopic blood, but the return was frankly positive for occult blood. During the last forty-eight hours the white blood count fell gradually to normal. The patient died in acute pulmonary edema with terminal abdominal distention.

The rise in pulse with a subsequent fall to a lesser level of elevation combined with the

drop in red cells, made it apparent that we were dealing with an internal hemorrhage, but it was equally clear that the hemorrhage tended to be limited. Mesenteric thrombosis became less probable in the absence of melena, hematemesis, and vomiting, with the fall to normal of the white blood count, and with no physical signs of advancing peritonitis. The lack of advancing peritonitis also tended to rule out acute pancreatitis. Although the recovery to a marked hypertension was against a coronary occlusion, it seemed equally illogical in advancing dissecting aneurysm with continuing loss of blood into the retroperitoneal space or abdomen.

In cases of coronary occlusion in the presence of extreme hypertension, a remarkable and illogical upward rise from the initial drop in blood pressure is by no means unknown. Owing to the difficulty of diagnosing dissecting aneurysm preceding death, there are relatively few records of blood pressure preceding the blowout, but that the blood pressure may fail to reach its previous level is proved by the third in Reisinger's series of 4 cases in which the blood pressure had been as high as 220/150 before admission and was maintained in the region of 160/120 following the acute onset.

In speaking of the characteristic pain of acute dissecting aneurysm and its similarity to that of acute coronary occlusion with sudden onset and collapse, it is stated by Osler that an electrocardiogram will not show changes incident to coronary occlusion in cases of dissecting aneurysm. This is not borne out by other observers. Reisinger reports a case with a preadmission electrocardiogram essentially normal. During the period of observation, in a second electrocardiogram the T waves in leads I to III were upright, the S-T segments in leads I and II were slightly elevated. A third electrocardiogram showed inversion of T waves in leads I and II without deviation of the S-T interval. A fourth still showed T waves in leads I and II inverted, and the T wave in lead IV was upright (minus). Two weeks before death, T waves in leads I and II were less deeply inverted and T waves in lead III were flat. T_a was still upright (minus). There was progressive decrease in voltage of QRS complexes. These changes were not associated with any gross or microscopic evidence of infarction, and the coronary ostia and arteries were not involved. Although no structural lesion in the heart was found to account for the abnormalities in the electro-

cardiograms, the fact remains that they developed after the onset of the dissecting aneurysm.

In this case the electrocardiogram on April 4 was interpreted as suggesting active acute small infarction. Granting that the electrocardiographic data in the literature is not sufficient to afford dependable evidence in cases of dissecting aneurysm, we know that only a completely negative electrocardiogram is of any service in ruling out coronary thrombosis. Since changes suggesting acute myocardial infarction have been frequently reported in cases of dissecting aneurysm and since such changes are present in this case, all that can be said is that their presence certainly is not in any way to be interpreted as against the diagnosis of dissecting aneurysm. It is quite possible that the first acute episode, said to have been a proved coronary thrombosis, was actually on the basis of aortitis involving the coronary ostia, with pain simulating that of coronary thrombosis.

DR KATHERINE R. KELLEY: What was the actual clinical diagnosis?

DR WASHBURN: The salient feature of the clinical examination in this case was the marked difference of the blood pressure in the two arms. It is almost unheard of to find such marked differences in anything but aneurysm of the aorta. There are few conditions in which the abrupt onset of pain of such catastrophic nature occurs. Dissecting aneurysm of the aorta is characterized by just this type of pain. That was the consensus.

DR BEECKMAN J. DELATOUR: What about a ureteral calculus?

DR WASHBURN: I have never seen a case of bilateral pain from a ureteral calculus. Such pain is classically unilateral.

DR DELATOUR: I wish to stress the point that dissecting aneurysms of the aorta do not show any characteristic electrocardiographic changes unless the dissection extends to involve the sinuses of Valsalva and interfere with the nutritional supply of the heart itself.

DR WASHBURN: As I mentioned in my preceding discussion, the work of Reisinger indicates that there may be electrocardiographic changes that are not dependent upon involvement of the coronary ostia at all. These changes are presumably due to myocardial anoxemia secondary to the alteration in the circulatory dynamics.

DR LOUIS F. BISHOP, JR.: In my opinion the electrocardiography is of no great value

in the diagnosis of dissecting aneurysm. If the electrocardiographic changes are present, they are an interesting adjunct to diagnosis, but I think that in this case at hand we should rely solely on the history and physical findings. We have no reason to doubt that history of typical coronary thrombosis and the changes in the electrocardiogram are quite in keeping with an old coronary with a suddenly added cardiac strain.

Dr. ARNOLD KOFFLER To my mind there are some arguments against the diagnosis of dissecting aneurysm. First, the pathogenesis of these cases is almost always arteriosclerotic. This man is young and does not show evidence of marked arteriosclerosis. Second, the aneurysm, if such it is, would have to be multiple because of the evidence pointing both to involvement of the ascending aorta and arch and also to the abdominal aorta.

Dr. WASHBURN This man is 45 years of age and is well within the age group for dissecting aneurysm. Again quoting Reisinger, the ages of his 4 cases were 41, 50, 48, and 39. There may be multiple points of dissection from a single rupture, involving a return to the lumen, or multiple tears. In one case there was a transverse tear 10 cm below the arch and a second tear 5 cm above the bifurcation into the iliac arteries.

INTERN How do you explain the 4 plus benzidine reaction in the stool?

Dr. WASHBURN In about 10 to 20 per cent of the cases of abdominal aneurysm of the aorta, the celiac axis is involved. In these, the dissection may extend to involve the coats of the intestine with seepage of blood resulting. One aneurysm of the splenic artery perforated the colon. I do not believe there was any gross hemorrhage into the bowel.

Dr. CHARLES H. NAMICK It seems to me that we are making the mistake that we are often prone to—losing sight of the main clinical features and trying to make a lot of irrelevant data fit into the picture. The history and physical examination in this case lead one directly to the diagnosis of dissecting aneurysm.

Dr. GEORGE C. McEACHERN Does not the rise in blood pressure after admission to the hospital practically rule out coronary thrombosis?

Dr. BISHOP I should say, yes, it would.

Dr. DELATOUR Another argument against a coronary is the fact that the white count was high on admission and began to fall on

the fifth day. In coronary thrombosis, the usual course of the white count is just the reverse of this.

Pathology

Dr. LESTER BREIDENBACH It was my impression when I first saw this patient that we were dealing with some kind of vascular episode. About thirty-six hours after admission I saw him on the medical ward, and there was to my mind a soft mass palpable in the right lower quadrant. I felt that it would be safer to keep him on surgery where he could be explored if he showed any signs of developing peritonitis. The body was that of a white adult man, well-preserved, with marked rigor mortis. On opening the abdominal cavity there was about 500 cc of blood in the peritoneal cavity. The cecum and part of the ascending colon were distended and pushed forward by a retroperitoneal hemorrhage. This mass in the right lower quadrant could easily have been palpable in life. On the right side, after the parietal peritoneum was cut, there was clotted and liquid blood extending all through the retroperitoneal space from right to left. The liver was natural and the gallbladder was distended, without stones. The right kidney was low on the right side, extended into the pelvis, was exceedingly long, and had two sets of vessels, one to the upper portion and one to the lower portion. The right lower renal artery was thrombosed. In connection with the suggestion made of renal colic, this infarction of the kidney may have been the cause of the acute severe pain present on admission. On tracing the hemorrhage medially, it was found to come from the aorta, the aorta was exceedingly friable with marked atherosclerosis and was the seat of a dissecting aneurysm beginning at the arch and extending right down to the iliac vessels. There was no left kidney. The pancreas was entirely normal but the heart was enlarged. The arch of the aorta was also enlarged and blue in color, and on section it showed a dissecting aneurysm with clot between the coats. The lungs were normal with slight hypostasis at the bases. There was no free fluid in the pleural cavities.

Diagnosis — Retroperitoneal hemorrhage from rupture of a dissecting aneurysm, horseshoe kidney, thrombosis of the renal artery, inferior, extension of dissecting aneurysm of the superior renal artery, massive infarction of lower half of the kidney.

drop in red cells, made it apparent that we were dealing with an internal hemorrhage, but it was equally clear that the hemorrhage tended to be limited. Mesenteric thrombosis became less probable in the absence of melena, hematemesis, and vomiting, with the fall to normal of the white blood count, and with no physical signs of advancing peritonitis. The lack of advancing peritonitis also tended to rule out acute pancreatitis. Although the recovery to a marked hypertension was against a coronary occlusion, it seemed equally illogical in advancing dissecting aneurysm with continuing loss of blood into the retroperitoneal space or abdomen.

In cases of coronary occlusion in the presence of extreme hypertension, a remarkable and illogical upward rise from the initial drop in blood pressure is by no means unknown. Owing to the difficulty of diagnosing dissecting aneurysm preceding death, there are relatively few records of blood pressure preceding the blowout, but that the blood pressure may fail to reach its previous level is proved by the third in Reisinger's series of 4 cases in which the blood pressure had been as high as 220/150 before admission and was maintained in the region of 160/120 following the acute onset.

In speaking of the characteristic pain of acute dissecting aneurysm and its similarity to that of acute coronary occlusion with sudden onset and collapse, it is stated by Osler that an electrocardiogram will not show changes incident to coronary occlusion in cases of dissecting aneurysm. This is not borne out by other observers. Reisinger reports a case with a preadmission electrocardiogram essentially normal. During the period of observation, in a second electrocardiogram the T waves in leads I to III were upright, the S-T segments in leads I and II were slightly elevated. A third electrocardiogram showed inversion of T waves in leads I and II without deviation of the S-T interval. A fourth still showed T waves in leads I and II inverted, and the T wave in lead IV was upright (minus). Two weeks before death, T waves in leads I and II were less deeply inverted and T waves in lead III were flat. T_4 was still upright (minus). There was progressive decrease in voltage of QRS complexes. These changes were not associated with any gross or microscopic evidence of infarction, and the coronary ostia and arteries were not involved. Although no structural lesion in the heart was found to account for the abnormalities in the electro-

cardiograms, the fact remains that they developed after the onset of the dissecting aneurysm.

In this case the electrocardiogram on April 4 was interpreted as suggesting active acute small infarction. Granting that the electrocardiographic data in the literature is not sufficient to afford dependable evidence in cases of dissecting aneurysm, we know that only a completely negative electrocardiogram is of any service in ruling out coronary thrombosis. Since changes suggesting acute myocardial infarction have been frequently reported in cases of dissecting aneurysm and since such changes are present in this case, all that can be said is that their presence certainly is not in any way to be interpreted as against the diagnosis of dissecting aneurysm. It is quite possible that the first acute episode, said to have been a proved coronary thrombosis, was actually on the basis of aortitis involving the coronary ostia, with pain simulating that of coronary thrombosis.

DR KATHERINE R. KELLEY: What was the actual clinical diagnosis?

DR WASHBURN: The salient feature of the clinical examination in this case was the marked difference of the blood pressure in the two arms. It is almost unheard of to find such marked differences in anything but aneurysm of the aorta. There are few conditions in which the abrupt onset of pain of such catastrophic nature occurs. Dissecting aneurysm of the aorta is characterized by just this type of pain. That was the consensus.

DR BEECKMAN J. DELATOUR: What about a ureteral calculus?

DR WASHBURN: I have never seen a case of bilateral pain from a ureteral calculus. Such pain is classically unilateral.

DR DELATOUR: I wish to stress the point that dissecting aneurysms of the aorta do not show any characteristic electrocardiographic changes unless the dissection extends to involve the sinuses of Valsalva and interfere with the nutritional supply of the heart itself.

DR WASHBURN: As I mentioned in my preceding discussion, the work of Reisinger indicates that there may be electrocardiographic changes that are not dependent upon involvement of the coronary ostia at all. These changes are presumably due to myocardial anoxemia secondary to the alteration in the circulatory dynamics.

DR LOUIS F. BISHOP, JR.: In my opinion the electrocardiography is of no great value

proximately 1,000 cc of foul-smelling sero-sanguino-purulent fluid. The liver and spleen were enlarged, the later weighing 1,000 Gm. There were several accessory spleens. The stomach was normal in size, the mucosa was markedly hypertrophied and the rugae were prominent. Polyps were not encountered. On the lesser curvature near the pylorus there was an old scar about 1.25 cm in diameter, stellate in shape. Its base was firmly adherent to the pancreas. The pyloric ring was patent. The pyloric end of the stomach was markedly thickened, measuring approximately 1 cm in diameter. This thickening tapered off gradually toward the fundal region where the thickness of the stomach wall was about 0.5 cm. Cut section through the thickest part of the stomach, i.e., the pyloric end, revealed dense grayish white tissue with some loss of demarcation of the different layers. In all other cut sections of the stomach the mucosa, submucosa, and muscularis were distinctly demarcated. The right ovary was enlarged and nodular, with a plum-sized cyst on its upper pole. The ovary itself was homogeneous and had the consistency of cheese. The left ovary was normal. The bone marrow was replaced throughout with firm white tissue.

Microscopic Findings—In multiple sections through the stomach the outstanding changes are found in the mucosa. The usual glandular outline is lost throughout.

The cells encountered are pleomorphic with many mitotic figures. They occur in strands and clumps separated by connective tissue fibers. In places these cells are polyhedral in shape and assume the pattern of pavement epithelium. Occasionally, signet cells are encountered. In the pyloric end, tubule-like structures are formed by medium-sized deep blue-staining cells.

Within the submucosa the cell type corresponds to the preponderant cells in the mucosa. Within the lymphatics the arrangement of the tumor cells is again that of pavement epithelium.

The mucosal lesion extends for a short distance into the duodenum and for a greater distance into the esophagus. Only a few lymphatics in the duodenum are filled by tumor cells whereas the lymphatics of the lower portion of the esophagus are densely packed.

The regional lymph nodes, the lymphatics of the lung, the adrenal, and the ovary show the same type of tumor cells.

In the ovary the cells do not assume any recognizable pattern, but collections of epi-

thelial cells are surrounded by connective tissue septums. Signet cells, though few in number, are easily recognized.

In the bone marrow the outstanding finding is the marked overgrowth by osseous tissue which almost obliterates the marrow space. Between these bone spicules nests of epithelial cells are arranged in pavement form.

The pulp of the spleen is filled with young cells of the erythropoietic and leukopoietic series. Collections of mature lymphocytes around the central arteries are no longer noted. The same hemopoiesis is seen to a lesser extent in the liver and adrenals.

Discussion

DR SAUL JARCHO. Four years ago a series of similar cases was reported under the title of "Diffusely Infiltrative Carcinoma" (*Arch. Path.* 22: 674-696, 1936). In these cases the patient was often young, the patient described by Dr. Johannsen was 37 years of age. The tumor was most often primary in the stomach or mammary gland. When it occurred in the stomach it was usually a carcinoma of the flat unobtrusive type, often it gave few or no symptoms, could not be palpated during life, and often escaped roentgen diagnosis. These primary carcinomas were accompanied by a fine type of infiltrative metastasis in the medullary cavities of the bones and in the pleuropulmonary lymphatics. The clinical picture was ordinarily dominated by the metastases, so that in those cases in which the infiltration was heavy in the lungs the clinical appearances were those of the so-called lymphangitic carcinomatosis of the lung, the most notable clinical characteristic of those cases was tachypnea. In those cases in which the infiltration was heaviest in the bone marrow the picture was that of thrombopenic purpura hemorrhagica with myelophthisic anemia. In addition to the marked reduction of platelets, these patients showed appreciable numbers of normoblasts or immature leukocytes in the circulating blood, such cases were sometimes characterized by various degrees of hepatic and splenic enlargement, due not to tumor tissue but to numerous foci of hematopoiesis in these organs. This occasionally resulted in the erroneous diagnosis of leukemia.

In the usual case of carcinoma in which there is a bulky primary tumor in the stomach the pathologist expects to encounter nodules of tumor in the liver, in cases of the type now under discussion these gross metastases are

REGULAR MEETING, DECEMBER 18, 1940

MAURICE N RICHTER, *President*

D MURRAY ANGEVINE, *Secretary*

Spontaneous Nontraumatic Rupture of Posterior Papillary Muscle of the Heart **Dr Caspar G Burn**

A spontaneous rupture of the posterior papillary muscle of the left ventricle was found at autopsy in a 68-year-old white man. The posterior wall of the left ventricle, including the papillary muscle, showed a fresh infarct. It is believed that in this instance the rupture of the papillary muscle was the result of excessive strain exerted by the hypertrophied musculature and shortened chorda tendineae upon the necrotic papillary muscle. Rupture of the papillary muscle was not diagnosed clinically, although a peculiar heart sound was interpreted as a friction rub.

Discussion

DR MAURICE N RICHTER: Were there any histologic changes at the site of rupture other than the necrosis?

DR CASPAR G BURN: There was just necrosis.

DR HERMAN SCHWARZ: Was there much pain associated with this syndrome?

DR BURN: Apparently not, the patient was in collapse. He did not seem to be suffering too much, and there was no note of pain on the clinical chart.

Carcinoma of Stomach Simulating Linitis Plastica with Squamous Cell Metaplasia, and Widespread Skeletal Metastases, Myelophthytic Anemia and Splenomegaly **Due to Compensatory Hemopoiesis** **Dr M W Johannsen**

This is the case of a 37-year-old Italian housewife admitted to the Third (New York University) Medical Division of Bellevue Hospital on October 2, 1940, with the complaints of generalized weakness of three weeks' duration and loss of weight. Two years before there was an episode of sour eructations and belching. Thereafter she was hospitalized four times, twice for hematemesis thought to be due to a bleeding peptic ulcer. In June, 1940, she was treated for left sciatic pain. Carious teeth were extracted. This operation led to profuse hemorrhage and necessitated five transfusions. Soon after this she was transferred to Bellevue Hospital.

The patient was markedly emaciated. The spleen was enlarged and smooth, and there was moderate tenderness in the midepigastrium. The pulse rate was persistently fast, ranging from 110 to 150. The temperature varied from 100 to 101 F with slight fluctua-

tions and terminally reached 104 F. The stools contained blood. The red blood cells ranged from 1,650,000 to 2,280,000, with a hemoglobin of 4.6 and 4.8 Gm, respectively. The color index was 0.9. The white blood cells numbered 5,850, and the Schilling index showed a marked shift to the left. The nucleated red blood cells were 6 per one hundred white blood cells, there were 0.3 per cent reticulocytes, the platelets numbered 145,000. The coagulation time was three and one-half minutes and the bleeding time, eleven minutes.

X-ray examination of the gastrointestinal tract showed findings interpreted as those of polyposis of the stomach.

A jejunostomy was performed on the eighteenth hospital day, and the patient expired thirty-six hours later.

Necropsy was performed twelve hours after death. The peritoneal cavity contained ap-

rather than that the disease is hereditary and due to an abnormality or a rearrangement of the chromosomes because of the peculiar collection of anomalies that are associated with the pancreatic anomaly. There are two possible ways in which the fetus could be affected in utero—one is infection, and one is deficiency of some food factor. Because there were several cases in which the mother was known to have a low fat diet I rather leaned toward the idea of a vitamin A deficiency not only as the result but as the cause of the disease. I have since had an opportunity to try out this hypothesis on rats, and I am convinced that I cannot do anything to the pancreas of the young by producing a vitamin A deficiency in the mother, at least in this species. Concerning the idea of this being due to a virus, you have collected proof in these cases that the inclusion bodies and the pancreatic lesion are associated, and this observation might be termed as strongly suggestive. It is now capable of confirmation by study of fresh cases, and it will be most interesting to watch the continuation of this work in the course of the next few years.

I have not hitherto been impressed by the association between the pancreatic fibrosis and the occurrence of inclusion bodies. We have somewhere between 25 and 30 cases of pancreatic fibrosis in our autopsy files, none of which show inclusion bodies, and we have about 6 other cases in which inclusion bodies have been found. It has so happened that the inclusion bodies have not been found in cases with pancreatic fibrosis. I have looked at the pancreas of every case for the last couple of decades and I am sure that is true, but we have not looked at the salivary glands routinely. I have looked at them in our cases of pancreatic fibrosis of the last couple of years since I have been aware of the syndrome, and I have not found inclusion bodies in the cases I have seen. That does not disprove Dr. Brody's hypothesis, and it will be of interest to see whether we can collect further evidence for or against it.

DR. VERA B. DOLGOPOL: What method of staining and fixation is used to demonstrate the inclusion bodies in the salivary gland?

DR. HENRY BRODY: We used a hematoxylin and eosin stain.

DR. ANDERSEN: May I add to my remarks one objection, which I should have mentioned before, and that is that I do not believe the lung changes are due to a virus disease but rather are the result of food deficiency. Since

we have been able to recognize the disease clinically we have given large doses of vitamin A to these patients, and we have not had any who have failed to survive for a matter of weeks. We have had a couple of babies with xerophthalmia who were given intensive vitamin A therapy. When they came to postmortem they had no signs of squamous epithelium anywhere. For example, in 1 case the xerophthalmia and the pneumonia began during the same week, at the age of 3 months. In spite of intensive vitamin A therapy the child died at 6 months. We could not see a sign of squamous epithelium anywhere.

DR. JACOB WERNE: Have the salivary glands in a similar control series of infants been studied and compared with those in the infants who have cystic fibrosis of the pancreas?

DR. BRODY: We have a short control series, about 25 cases,* and in none of these have any inclusion bodies been found. The only inclusion bodies we have seen have been in the cases of cystic fibrosis of the pancreas. In the earlier reported series inclusion bodies have been found without cystic fibrosis.

QUESTION FROM AUDIENCE: What is the clinical symptomatology?

DR. BRODY: I will ask Dr. Andersen to answer that.

DR. ANDERSEN: The syndrome is by now clear enough so that none of our last 6 cases have come to postmortem undiagnosed. Usually the child appears normal at birth, and in many cases there is a history of a previous sibling (usually the one before the patient, but not always) having died during the first year of life from pneumonia. The present child appeared normal at birth. In about one-half the cases, during the first week or so, someone notices that the stools are unusually foul-smelling and large, but in many cases that is not noted until the child is a month old. Sometimes it is first observed when the child is given cereal, because cereal is not digested well in the absence of the pancreas and it aggravates the abnormal state of the stool. The child does well for a month or two and gains normally, then it fails to gain, it eats twice as much as the other children in the family are in the habit of eating, gains very slowly, and then gets pneumonia. I checked the time interval of the pneumonia carefully. The youngest of all is 7 weeks. The baby is brought into the hospital, usually because of the pneumonia, not because of the feeding difficulty. We have had some come in because

* Sixty cases at time of reading proof.

not found. The series of cases of "Diffusely Infiltrative Carcinoma" was also found to include a considerable number of Krukenberg tumors of the ovary. It would seem from the sections displayed by Dr. Johannsen that Krukenberg tumor was also present in his case.

DR. IRVING GRAEF I had the opportunity of studying Dr. Johannsen's case. I should like to add a word about the surgeon's findings. At operation, inspection of the stomach failed to reveal a mass that the surgeon felt he could implicate as tumor, and he thought he was dealing with diffuse hypertrophic gastritis and referred to areas of edematous infiltration of the stomach, he took a biopsy from a zone of marked edema without having a definite idea that there was a neoplasm present. It was only the microscopic study

of this case which disclosed an extensive involvement, and in line with the observations of Dr. Jarcho it is interesting to point out that here is a tumor that has a growth potential of such slow speed that it was able to compromise the entire stomach. Sections from the esophageal sphincter to the pyloric sphincter all revealed the transformation in varying degrees, and there was *limitis plastica* in portions of the stomach. Yet this patient was in comparatively good nutrition until the last weeks of her illness. It seems likely that the lesion developed at least two years ago and was in the process of evolution during that time. It furnishes a contrast with one's ordinary concept of the rapidly infiltrating small tumors that gain a foothold in the lymphatics and then pursue their rapidly fatal course.

Concerning the Etiology of Cystic Fibrosis of the Pancreas Dr. Henry Brody (Abstract)

Cystic fibrosis of the pancreas is a disease of infants characterized by pancreatic insufficiency, frequently complicated by vitamin A deficiency, and is usually fatally terminated by pulmonary infection. Pathologically, the pancreas shows fibrosis and cystic dilatation of ducts and acini, which may contain inspissated secretion. An inflammatory infiltration is usually present. The main pancreatic ducts may or may not be atretic. The chronic pulmonary infection that is the usual cause of death manifests itself as a bronchitis, interstitial pneumonia and bronchiectasis.

A number of explanations have been proffered for the pathogenesis of the pancreatic affection: (1) production of an abnormal secretion that inspissates and leads to distention and atrophy of ducts and acini, (2) vitamin A deficiency in fetal life, (3) congenital malformation, and (4) inflammation of pancreas during fetal life.

I should like to present evidence that an intrauterine virus infection is the most likely cause. That a virus is responsible for the lesion was suggested by the finding of intranuclear and cytoplasmic inclusion bodies in certain tissues in 2 of 3 cases of cystic fibrosis of the pancreas observed in our laboratory—in 1 case in the salivary glands, bronchial and pulmonary epithelium, in the other only in the salivary glands. In our third case the salivary glands were not available for examination. Stimulated by this, we made a search through the literature. Five cases with intranuclear inclusions were found in which there was associated cystic fibrosis of the pancreas. In

2 others it is probable that cystic fibrosis was present and, in still 2 more, slight interstitial fibrosis of the pancreas was described.

The familial tendency could be explained if the mother is a carrier of the virus that was transmitted across the placenta. Obviously, the lesion would be present at birth. The associated anomalies that have been reported are almost all atresias or stenoses of epithelial passages rather than the usual heterogeneous congeries found in infants dying with multiple congenital malformations. These may all have a common inflammatory cause. In several cases accessory pancreatic nodules isolated spatially from the main body showed the same histologic changes, suggesting the action of a specific histotropic agent.

Intranuclear inclusions, entirely similar to those found in the human infant, are found in the salivary glands of animals where they have been proved to be caused by a virus.

The evidence marshalled in proof of virus etiology of cystic fibrosis of the pancreas is, unfortunately, incomplete. It is to be hoped that this presentation will stimulate the necessary investigations that will, by statistical weight, either prove or disprove the hypothesis herein outlined. The final proofs, of course, will follow the isolation of the virus.

Discussion

DR. DOROTHY H. ANDERSEN I came feeling rather skeptical, but I am now convinced that there is a great deal in Dr. Brody's hypothesis. I have felt from my own cases that something happens to the fetus in utero

dock and Smith were an interstitial pneumonia, and they state that they were strikingly like the virus pneumonias studied by McCordock and Muckenfuss in children and in animals. That similarity suggests that the lung lesion also might be evidence of virus infection.

DR JOSEPH VICTOR. Dr Brody has given an interesting and lucid discussion of his hypothesis and has left enough loopholes for further possibilities. The whole hypothesis, it seems to me, depends on the significance one places on the inclusion body. Does the inclusion body represent a virus infection or is

it secondary, in this particular instance, to a nutritional disturbance? I know of no example where an inclusion body is secondary to nutritional disturbance which has been reported. Recently, in our laboratory we have been studying riboflavin deficiency in swine and have found that 3 of 4 swine on a riboflavin-deficient diet coming down with the deficiency syndrome have shown changes in the corneal epithelium. The cellular changes are characterized by enormous inclusion bodies in the nuclei. I think this indicates another possibility in the interpretation of inclusion bodies in the salivary glands.

Phosphatase in Normal and Malignant Tissues Dr Jacob Furth and Dr E A Kabat (*by invitation*)

The technic described by Takamatsu and by Gomori for the histochemical demonstration of phosphatase is specific for this enzyme.

Alkaline-phosphatase activity is characteristic of certain cells. Normal cells particularly rich in phosphatase are epithelium of the small intestine, that of proximal convoluted tubules, osteoblasts, and endothelium.

Of the tumors studied, phosphatase was present in conspicuous amounts in malignant osteoblasts of a transmissible chicken sarcoma and in an osteogenic tumor of the mouse. In the osteogenic chicken sarcoma, phosphatase is particularly abundant about the sites of bony and cartilaginous deposits. In three non-bone-forming strains of transmissible chicken sarcoma, phosphatase is absent.

Human fibroadenoma of the breast contained much phosphatase, as did lactating breast, while this enzyme was absent in carcinoma of the breast.

In the liver and spleen, endothelial cells alone contain phosphatase. Kupffer cells and histiocytes do not contain phosphatase.

The presence of phosphatase in normal and malignant osteoblasts supports the concept of its role in bone formation and may aid in the histologic identification of osteogenic cells.

The presence of large amounts of phosphatase in the intestinal epithelium is in accord with the views of Lundsgaard on the relation of glucose absorption to phosphorylation. Similarly, its presence in the proximal convoluted tubules of the kidney reopens the question of a similar mechanism explaining the reabsorption of the glucose secreted by the glomeruli.

Glycine, a known inhibitor of phosphatase

action, inhibits the phosphatase reaction in tissue sections.

Discussion

DR E A. KABAT. I might say a word about the properties of the enzyme. It should be pointed out that the brown pigment one sees is not the actual enzyme but merely its activity made visible at the site where it occurs in the tissue, and the question arises: Is the method specific for phosphatase? To that it may be said that the properties of the enzyme tissue section, as closely as we have been able to determine, parallel the properties of the autolyzed tissue extracts in their behavior, that is, large amounts of amino acids have been shown to inhibit phosphatase activity of tissue autolysates, and 0.25 M glycine completely inhibited phosphatase activity in sections of kidney, intestine, bone, and capillary endothelium.

The function of phosphatase has been of considerable interest. Robison pointed out that the phosphatase in osteogenic tissue might provide a local concentration of phosphate at the site of bone formation. Lundsgaard found that phlorhizin prevents glucose absorption in the small intestine and produces glycosuria by preventing reabsorption of glucose in the proximal convoluted tubules. He suggested that phosphorylation was an intermediate stage in the absorption of carbohydrate, glucose, through the intestinal wall and through the proximal convoluted tubules of the kidney, and that the phosphatase subsequently dephosphorylated the glucose phosphate. The localization of the enzyme histochemically in both of these places, the con-

of a failure to gain, and if they are brought in before there is much respiratory infection we can sometimes treat them successfully. We have 3 who have been treated, are now getting along well, and are over their pneumonia, or nearly so. They are between $1\frac{1}{2}$ and 2 years old now, so that this is another point that makes me feel that the feeding has something to do with the lung infection.

The confirmation of the diagnosis is made partly by the appearance of the patient, who has a characteristic celiac appearance, and partly by the response to pancreatin. In all the cases I have studied there has been a low serum cholesterol, the total cholesterol is well below 100 in most of them, sometimes it is as low as 60. They respond to pancreatin, a high-protein diet, and vitamin A. If this treatment is persisted in and we get them early, before the respiratory infection is severe, this will permit them to grow and recover. We have 3 out of the 10 cases diagnosed during life in the past two years who are getting along nicely at the moment. This still indicates a poor prognosis but is better than the zero out of 10 of our previous cases.

DR GRAEF: We have all been impressed by Dr Brody's hypothesis, but there are two or three points in the evidence which I should like to ask him to clarify a little. I am under the impression that the salivary gland virus noticed in childhood manifests itself as a simple intranuclear inclusion without any inflammatory changes at all. Have any changes been observed in the salivary gland not only in Dr Brody's own cases but in those reported by others? Secondly, I did not understand whether inclusions were found in the pancreas in Dr Brody's cases or in other cases. The third point is, is it wise to include the bronchopneumonic syndrome in this particular picture when we know this type of bronchopneumonia is the form that brings most of the infant population to autopsy when it dies of pneumonia? In the last ten years I have been studying pneumonia with Dr Charles Hendee Smith, and I have collected 60 cases of bronchopneumonia in this series. In them I have seen 2 cases with inclusion bodies. One was of the salivary gland type, and this was a single lesion unassociated with any other inflammation. The other was a dubious case and one that I have never been satisfied about. Recently, I have seen another human case with inclusion bodies, a case sent to Dr Francis from St. Paul, in which inclusion bodies were found throughout the lung. And you know Goodpasture's re-

port of last year on the occurrence of inclusion bodies in infants, from which he was able to recover a virus transmissible to animals. As I recall the report, the disease was nothing but an acute infection. This brings me to my last point—is it not possible that we are dealing with a separate pneumonic process superimposed on a chronic lesion like those that have been demonstrated in the pancreas? You used the term "chronic bronchopneumonia" and illustrated it with mononuclear cells in the bronchi. In various lesions in animals and in the rapidly fatal bronchopneumonia in man, there is a mononuclear cell proliferation early in the disease. I mention this not in the spirit of carping but with the desire of separating the different factors concerned in the picture.

DR BRODY: I should like to make one comment on what Dr Andersen said. In our last case I think all the therapeutic procedures she suggests, including 100,000 units of vitamin A daily, both parenterally and by mouth, were used, and yet the child had a rather rapid exitus. I do not know whether that has any bearing.

In reply to Dr Graef's questions, in the second case I showed that in the salivary gland there was an inflammatory reaction, although I am not sure that it was directly proportional to the number of inclusion bodies present. In McCordock and Smith's experimental work I believe that there was also an inflammatory reaction, which in time disappeared, leaving only the inclusion bodies, so that I do not think the presence or absence of inflammation at the time of autopsy is indicative of whether there was any reaction to the virus in the course of the disease. In the cases that I have had the opportunity to examine there were no inclusion bodies in the pancreas. In some cases in the literature there have been, although I do not believe in any cases of cystic fibrosis, but the inclusion bodies were found in the pancreas only in fetuses, in stillborns, and in infants of a few days of age. Again, as I pointed out before, that seemed to be the course in the experimental animal where they tend to disappear in the visceral organs and remain only in the salivary glands for reasons that are unknown.

About the changes in the lung, I do not want to insist that this is part of the syndrome. We have had only 3 cases, and perhaps in our cases the interstitial pneumonia was not as striking as in some of the cases in the literature, certainly the cases of McCor-

dock and Smith were an interstitial pneumonia, and they state that they were strikingly like the virus pneumonias studied by McCordock and Muckenfuss in children and in animals. That similarity suggests that the lung lesion also might be evidence of virus infection.

DR JOSEPH VICTOR. Dr Brody has given an interesting and lucid discussion of his hypothesis and has left enough loopholes for further possibilities. The whole hypothesis, it seems to me, depends on the significance one places on the inclusion body. Does the inclusion body represent a virus infection or is

it secondary, in this particular instance, to a nutritional disturbance? I know of no example where an inclusion body is secondary to nutritional disturbance which has been reported. Recently, in our laboratory we have been studying riboflavin deficiency in swine and have found that 3 of 4 swine on a riboflavin-deficient diet coming down with the deficiency syndrome have shown changes in the corneal epithelium. The cellular changes are characterized by enormous inclusion bodies in the nuclei. I think this indicates another possibility in the interpretation of inclusion bodies in the salivary glands.

Phosphatase in Normal and Malignant Tissues. Dr Jacob Furth and Dr E. A. Kabat (*by invitation*)

The technic described by Takamatsu and by Gomori for the histochemical demonstration of phosphatase is specific for this enzyme.

Alkaline-phosphatase activity is characteristic of certain cells. Normal cells particularly rich in phosphatase are epithelium of the small intestine, that of proximal convoluted tubules, osteoblasts, and endothelium.

Of the tumors studied, phosphatase was present in conspicuous amounts in malignant osteoblasts of a transmissible chicken sarcoma and in an osteogenic tumor of the mouse. In the osteogenic chicken sarcoma, phosphatase is particularly abundant about the sites of bony and cartilaginous deposits. In three non-bone-forming strains of transmissible chicken sarcoma, phosphatase is absent.

Human fibroadenoma of the breast contained much phosphatase, as did lactating breast, while this enzyme was absent in carcinoma of the breast.

In the liver and spleen, endothelial cells alone contain phosphatase. Kupffer cells and histiocytes do not contain phosphatase.

The presence of phosphatase in normal and malignant osteoblasts supports the concept of its role in bone formation and may aid in the histologic identification of osteogenic cells.

The presence of large amounts of phosphatase in the intestinal epithelium is in accord with the views of Lundsgaard on the relation of glucose absorption to phosphorylation. Similarly, its presence in the proximal convoluted tubules of the kidney reopens the question of a similar mechanism explaining the reabsorption of the glucose secreted by the glomeruli.

Glycine, a known inhibitor of phosphatase

action, inhibits the phosphatase reaction in tissue sections.

Discussion

DR E. A. KABAT. I might say a word about the properties of the enzyme. It should be pointed out that the brown pigment one sees is not the actual enzyme but merely its activity made visible at the sites where it occurs in the tissue, and the question arises: Is the method specific for phosphatase? To that it may be said that the properties of the enzyme tissue section, as closely as we have been able to determine, parallel the properties of the autolyzed tissue extracts in their behavior, that is, large amounts of amino acids have been shown to inhibit phosphatase activity of tissue autolysates, and 0.25 M glycine completely inhibited phosphatase activity in sections of kidney, intestine, bone and capillary endothelium.

The function of phosphatase has been of considerable interest. Robison pointed out that the phosphatase in osteogenic tissue might provide a local concentration of phosphate at the site of bone formation. Lundsgaard found that phlorhizin prevents glucose absorption in the small intestine and produces glycosuria by preventing reabsorption of glucose in the proximal convoluted tubules. He suggested that phosphorylation was an intermediate stage in the absorption of carbohydrate, glucose, through the intestinal wall and through the proximal convoluted tubules of the kidney, and that the phosphatase subsequently dephosphorylated the glucose phosphate. The localization of the enzyme histochemically in both of these places, the con-

volute tubule and the intestinal loop, supports this contention Ellinger made azo dyes containing phlorhizin, and he found that the phlorhizin dye when fed to animals was localized in the proximal convoluted tubules and the glucosuria was produced simultaneously Hence, we have a localization of phosphatase and phlorhizin in the proximal convoluted tubule of the kidney These observations provide strong circumstantial evidence in support of Lundsgaard's hypothesis Lundsgaard, after proposing this theory, retracted it, because the quantitative relationship in the amount of phlorhizin necessary to produce glucosuria was much less than that needed to inhibit phosphorylation. However, he calculated his data on the basis per gram of kidney tissue and, since the phlorhizin is localized only in the proximal convoluted tubules, this apparent quantitative objection is not valid

DR AARON BODANSKY (*by invitation*) I should like to ask whether you have tried the effect of long fasting on the phosphatase content of the mucosa I should also like to ask whether you have seen any tumors of the liver or diseases of the liver

DR KABAT We have had 1 case of metastasis to the liver from an intestinal carcinoma, and the metastasis did not show phosphatase

DR GRAEF What do the parathyroids show?

DR JACOB FURTH The parathyroids were not examined

DR ALFRED PLAUT There are unfortunately so many doubtful epithelial structures in the diagnosis of carcinoma of the breast. Did you find any intermediate phosphatase reactions corresponding to these borderline lesions?

DR FURTH The cases studied were clear-cut carcinomas It will be of interest to compare the histologic appearance and the phosphatase content of a series of cases that offer diagnostic difficulties

DR RICHTER Can this reaction be performed in sufficiently short time so that it would be of practical importance in rapid diagnosis?

DR KABAT You mean is it applicable to frozen sections? I do not think we have done any, but we did do a few gelatin sections and they seemed to be satisfactory—that is, embedding in gelatin and cutting by frozen section Running the whole procedure through takes about three hours

DR BURN Have you studied tissue cultures in relation to this reaction?

DR FURTH We have examined a few but the results were not conclusive

THE WOMEN'S STATE MEDICAL SOCIETY

Dr Marguerite P McCarthy, of Solvay, was elected president of the Women's Medical Society of New York State at the annual meeting in Buffalo on April 28

Other officers chosen were vice-presidents, Dr Mary E Cotter, Brooklyn, and Drs Theresa Scanlon and Isabel Scharnagel, New York, and secretary, Dr Isabelle F Borden, Albany

Councillors are Dr Isabel Knowlton, New York, Dr Cora M Ballard, Brooklyn, Dr Rosetta F Hall, Liberty, Dr Annetta E Barber, Glens Falls, Dr Elizabeth L Shrimpton, Syracuse, Dr Anna M Stuart, Elmira, Dr Kathleen L Buck, Rochester, and Dr Alta Sager Green, Williamsville

A resolution recommending that women physicians and surgeons of America be made eligible for the Medical Reserve Corps of the United States Army and Navy and be granted the full privileges thereof was passed at an executive session

The meeting culminated in a dinner in the

evening at the Hotel Statler, when ten women who have practiced for half a century or more were honored

Dr Alice Stone Woolley, outgoing president of the society, presided at the dinner Mrs Helen Z M Rodgers spoke on "The Professional Woman in This Democratic World" and Dr Margaret Warwick Schley on "The 'Lady Doc'—What Is She?"

The honor guests, who received gold keys, were

Dr Anna Sturges Daniel, Women's Medical College, 1879, Dr Marian Craig Potter, Dr Sarah Buckley, and Dr Mary Louise Lines, Michigan, 1884, Dr Rosetta Sherwood Hall, Women's Medical College, 1889, Dr Mary T Greene, Michigan, 1890, Dr Ethel Doty Brown, Women's Medical College, 1890, Dr Alice Bennett, University of Buffalo, 1890, Dr Jeannette Himmelsbach, University of Buffalo, 1891, and Dr Fanny Hurd Brown, Michigan, 1891

SCHOOL PHYSICIANS TO MEET

The New York State Association of School Physicians will hold its Annual Meeting and Conference on June 23 at the Grand Union Hotel, Saratoga Springs, New York. A worth-

while program of interest to school physicians, nurses, dental hygienists, health officers, and general practitioners will be presented at the afternoon and evening sessions

Index of Minutes of House of Delegates—1941

The minutes of the Monday morning and afternoon sessions are included in this issue (Sections 1-63). The minutes of the Monday evening and Tuesday sessions will appear in the July 1 issue (Sections 64-88).

HOUSE OF DELEGATES

MINUTES OF THE ANNUAL MEETING

April 28 and 29, 1941

THE 135th Annual Meeting of the House of Delegates of the Medical Society of the State of New York was held at the Hotel Statler, Buffalo, New York, on Monday, April 28, 1941, at 10 00 A M

Dr Louis H Bauer, Speaker, Dr William Hale, Vice-Speaker, Dr Peter Irving, Secretary, Dr Edward C Podvin, Assistant Secretary

SPEAKER BAUER The House will be in order

1 Report of the Reference Committee on Credentials

SPEAKER BAUER The Chair recognizes Dr Peter Irving, Chairman of the Reference Committee on Credentials

SECRETARY IRVING Mr Speaker, there are no disputed delegations, and all who have been seated are entitled to vote

SPEAKER BAUER I declare the 135th Session of the House of Delegates to the Medical Society of the State of New York open for the transaction of business

The Secretary will call the roll

2 Roll Call

Secretary Irving called the roll by counties and stated "There is a quorum present"

3 In Memoriam of Dr Guy S Carpenter (Section 78)

SPEAKER BAUER I shall ask the members of the House to rise for a moment in memory of Dr Guy S Carpenter who passed away since our last session

The delegates arose and stood for a moment in silence in memory of Dr Guy S Carpenter

4 Approval of the Minutes of the 1940 Session

SPEAKER BAUER The first order of business is the approval and adoption of the minutes of the 1940 Session of the House

SECRETARY IRVING Mr Speaker, I move that the reading of the minutes of the 1940 Session of the House be dispensed with, and that they be approved and adopted as published in the June 15 and July 1 issues of the NEW YORK STATE JOURNAL OF MEDICINE

DR. CLARENCE G BANDLER, New York I second that motion

There being no discussion, the motion was put to a vote, and was unanimously carried

5 Address by Dr Nathan B Van Etten, President of the American Medical Association

SPEAKER BAUER I should like to have Dr Chas Gordon Heyd act as a committee of one to escort the President of the American Medical Association to the platform

(The delegates arose and applauded as Dr Chas Gordon Heyd escorted Dr Van Etten to the platform)

SPEAKER BAUER Members of the House, I

want to present to you the President of the American Medical Association. It is always an honor to have the president of that association attend our meetings, but the honor is doubly great when he is a member of this House of Delegates and a past-president of our own Society.

It gives me great pleasure to welcome him here to the rostrum. I cannot offer him the privilege of the floor because he already has it, but I can offer him a seat on the platform during the rest of this session, and I hope he will occupy it.

DR. VAN ETEN, the House will be glad to hear from you at this time.

DR. NATHAN B VAN ETEN I greatly appreciate the esteem of this House. No one could ask for anything more. I am not at all sad about the fact that this is my last appearance before this House as an officer of Organized Medicine. A career of more than forty years in medical societies has given me a great deal of stimulation which I could hardly have experienced in any other way. Although my bones are old, my enthusiasm for the progress of medicine is as fresh as ever.

The evolution of medicine and of the public health through the last fifty years cannot fail to inspire my imagination in looking forward to accomplishments that will make the past look pale and colorless.

Fifty years ago we were just as up to date as we are today, but none of us can practice the kind of medicine we learned at that time. I shall not review the details of this period of modern medicine, much of it merely historically interesting, but here we are at the beginning of new chemotherapy, new and daring surgery, new physical revelations, new prospects which are so amazing that no one can fail to look eagerly into the immediate future.

I am profoundly grateful for fifty years of medical experience and frankly jealous of those of you who will see the developments of the next half century.

The Medical Society of the State of New York has been exceedingly fortunate in that no adverse legislation has interrupted its progress, that its JOURNAL has so greatly improved, that its department of public relations is taking so important a place in the medical social intelligence of the whole country, and that its general management has met such a measure of success.

No one can plot the social dangers of the next five years, but the fact that 95 per cent of the active practitioners of the United States are loyal and willing to serve the country in her military forces is heartening evidence of the high character of the most learned of all professions.

The appalling prospect of war disturbs us to the depths of our emotions, but we must not let even the experience of war dislocate our mentality, so that we shall forget what we have been fighting for all of our professional lives.

We have been fighting for the American way

of life in a free democracy We must be aware of the dangers of domination by the state in a national emergency, and we must resist it wherever it threatens our ideals for national health We may, perchance, be soldiers for a little while, but let us keep our heads and remember that we shall be physicians for the rest of our lives

Abraham Lincoln said "As I would not be a slave, so I would not be a master This expresses my idea of democracy Whatever differs from this, to the extent of the difference is no democracy"

War is devastating, but the cohesive influence of our altruistic tradition will help us to survive and to continue to maintain the really high health standards of the American people in the American way (Applause)

SPEAKER BAUER Thank you, Dr Van Etten I will ask the Secretary to read the Reference Committee appointments

6 Reference Committees

SECRETARY IRVING These are the Reference Committee appointments

REFERENCE COMMITTEE ON CREDENTIALS

Peter Irving Chairman New York County
John L Edwards Columbia County
Charles F McCarty Kings County
Edward C Podvin Bronx County

Joseph C O Gorman Erie County
Joseph Wrana Queens County

There is no report of the Censors this year we are glad to say

REFERENCE COMMITTEE ON REPORTS OF SECRETARY AND DISTRICT BRANCHES

Stephen R Monteith Chairman Rockland County
W Grant Cooper St. Lawrence County
Frederic W Holcomb Ulster County
William A Moulton Tioga County
Denver M Vickers Washington County

REFERENCE COMMITTEE ON NEW BUSINESS I

Leo F Simpson Chairman Monroe County
David W Beard Schoharie County
Edgar Bieber Chautauqua County
Moses H Krakow Bronx County
Thomas A McGoldrick Kings County

REFERENCE COMMITTEE ON NEW BUSINESS II

Peter J DiNatale Chairman Genesee County
Albert A Cinelli New York County

Joseph P. Henry, Monroe County
A. W. Martin Marino, Kings County
F. Leslie Sullivan, Schoenectady County

REFERENCE COMMITTEE ON NEW BUSINESS C

John J. Masterson, *Chairman*, Kings County
J. Lewis Amater, Bronx County
John L. Sengstack, Suffolk County
G. Scott Towne, Saratoga County
Carleton E. Wertz, Erie County

Mr. Speaker, I move that the reports of the officers, council, trustees, legal counsel, and district branches that have been published and distributed to the members of the House be referred to the respective reference committees without reading.

DR. WALTER P. ANDERTON, *New York* I second that motion.

There being no discussion, the motion was put to a vote, and was unanimously carried.

7 Supplementary Report of the President

(Section 46)

SPEAKER BAUER Dr. Winslow, will you escort the President of the Medical Society of the State of New York to the platform?

(The delegates arose and applauded as Dr. Floyd S. Winslow escorted Dr. James M. Flynn to the platform.)

SPEAKER BAUER Dr. Flynn, it seems as though you should be up here wielding this gavel.

PRESIDENT FLYNN Thank you!

SPEAKER BAUER I know the House is very anxious to hear from you at this time.

Gentlemen, I present to you your President. (Applause)

PRESIDENT FLYNN Mr. Speaker and Members of the House, may I thank you for this wonderful ovation.

I have no supplementary report to make. I might say that all of the committees of the Council have done a great piece of work, but there is one committee that stands out in my mind as doing just a little bit more work every year, and that is Dr. Mitchell's Committee on Public Health and Education. (Applause)

I feel that the Council should go deeply into the workings of that committee, and see just what can be done to give Dr. Mitchell a little more support not alone in increasing the numbers of his committee but in a financial way. I think if the House would give permission to the Council to give the affairs of this committee a thorough study it would certainly be worthwhile because in my mind Dr. Mitchell's committee is probably doing more for the Society as a whole than anything that we have undertaken to do.

The report that I have made, of course, is printed in the JOURNAL and also in the reports that have been distributed to you here. There is nothing further that I wish to add.

Again I thank you for your kind ovation and cooperation during the year. (Applause)

SPEAKER BAUER Thank you, Dr. Flynn!

The remarks of the President are referred to the Reference Committee on the Report of the President.

8 Address of the President-Elect

SPEAKER BAUER Will Dr. Hellman, as President of the Medical Society of the County of New York, escort the President-Elect of the Medical Society of the State of New York to the platform.

(The delegates arose and applauded as Dr. Alfred M. Hellman escorted Dr. Samuel J. Kopetzky to the platform.)

SPEAKER BAUER Dr. Kopetzky, we welcome you to the platform which you graced for so many years. The House is very anxious to hear from you at this time.

PRESIDENT-ELECT KOPETZKY Mr. Speaker and Gentlemen, at this time, at the onset of what I hope will be as successful an administration as that which is just terminating in this meeting, there is very little in the form of a program that I want to offer.

We are facing very difficult times. We are in an emergency. At all times in this country when an emergency arose it became the prime duty of patriotic citizens to see to it that all the aspects and facets of freedom were maintained. When the Army of the Republic disbanded after its march down Pennsylvania Avenue in '61, that was an achievement of democracy.

After the last World War when four and one-half million men were demobilized, and the aspects of military service disappeared and the uniforms dropped from sight, that again was an evidence of vital democracy.

Many, and particularly the medical profession, are fearful that in the evolution of procedures necessary in the emergency, demobilization cannot as easily or will not as easily be accomplished after the termination of the emergency which we now face. It should be our prime duty to use as a standard of measurement of any procedure and any scheme involving the medical profession—it should be our measuring rod to see to it that it is a temporary emergency measure, easily demobilized.

If the thinking portion of the profession, who know what we want to maintain, will work together to the end that every scheme and every idea advanced under the cloak of a defense program is so constructed that with the disappearance of the emergency it also shall disappear, we shall stand as the President of the American Medical Association said, with all the hard-won advances we have made safe.

This is the prime message I have to deliver to you at this time. We shall have to adjust to temporary expediences, but in that adjustment let there be no element of permanency.

I thank you! (Applause)

SPEAKER BAUER Dr. Kopetzky, we thank you, and will be glad to have you sit up here on the rostrum with us.

Mr. Secretary, are there any supplementary reports?

SECRETARY IRVING There are two supplementary reports, Mr. Speaker. One is from the Council on Legislation, which has been distributed to the members of the House. The other will be from the Treasurer, who would like to read that report himself. The supplementary report of the Council, Part VII—Legislation, as distributed to the delegates is as follows:

9 Supplementary Report of the Council Part VII—Legislation

(Section 77)

The Council begs to transmit the final report of its Committee on Legislation, Dr. John L. Bauer, Brooklyn, *Chairman*, Dr. Walter W.

Mott, White Plains, and Dr Leo P Simpson, Rochester

The following is a report on the various bills up to April 9, 1941. It cannot be complete until after the expiration of the 30-day period allowed the Governor for action on the bills, which are in his hands

BILLS SIGNED

Senate Int 352—Page, Assembly Int 712—Milroe, prohibits *podiatrists* from advertising in any publication or using flamboyant or large display, or glaring or flickering sign or a representation of human foot or leg or an appliance used in treatment. Chapter 103 of the Laws of 1941

Senate Int 453—Hampton, Assembly Int 501—Wright, prohibits *medical expense indemnity and hospital service corporations* from employing *solicitors* or accepting business from brokers on commission basis, solicitors are to be paid on salary basis only and exempt from obtaining license. Chapter 70 of the Laws of 1941

Senate Int 684—Hastings, Assembly Int 849—Wadsworth, reduces local share for *home relief* for 1941 from 80 to 40 per cent, for 1942 from 100 to 60 per cent, for 1943 from 100 to 80 per cent, provides that determination of *medical care* shall be with advice of physician, strikes out the provision that one-half of Federal funds shall be used for expenses of State Department, and makes other changes. Chapter 82 of the Laws of 1941

BILLS IN HANDS OF GOVERNOR

Senate Int 162—Hastings, Assembly Int 173—C D Williams, authorizes *school district trustees*, as well as education boards and union free school districts, to furnish instruction for *physically handicapped children*, including remedial instruction, and provides for state aid to help pay teachers giving such instruction.

Senate Int 267—Thompson, Assembly Int 191—Moffat, allows manager of laboratory to appeal for state aid to Governor, instead of to the laboratory appeal commission as at present

Senate Int 289—Halpern, Assembly Int 197—Wagner, allows award in *workmen's compensation* cases for protracted temporary total disability in connection with permanent partial disability of 25 weeks for loss or partial loss of hearing

Senate Int 347—Stokes, Assembly Int 290—Backus, provides for care and maintenance at state expense of *patients in state tuberculosis hospitals* having for public welfare purposes no legal settlement in any town or city

Senate Int 475—Muzzicato, Assembly Int 211—Lomis, fixes penalty for violation of the *Sanitary Code* applicable outside New York City, at fine of not exceeding \$50 or imprisonment for not exceeding six months, or both.

Senate Int 588—Mahoney, Assembly Int 746—Todd, extends to January 1, 1942, time when *nurses* must be *licensed* for practice in this state, permits Education Department to admit to examination graduate nurses of other states, and permits practice pending results of examination for license

Senate Int 936—Desmond, Assembly Int.

1221—Peterson, permits court, upon trial of persons arrested for operating *motor vehicle* or motorcycle while in an intoxicated condition, to admit in evidence amount of alcohol in defendant's blood as shown by medical or chemical analysis of breath, blood, urine or saliva

Senate Int 1009—Bechtold, Assembly Int 1241—Rapp, permits the suspension or revocation of *motor vehicle licenses* and certificates of registration when holder is committed by court institution under jurisdiction of the Mental Hygiene Department

Senate Int 1010—Hampton, Assembly Int 1245—Wright, requires that nonprofit *medical indemnity and hospital service corporations* shall set aside on December 31, 1941, *special contingent surplus fund* equal to one-half of surplus funds over reserve and other liabilities and four per cent of net premium income during year, but not to exceed twenty per cent of incurred losses or amount of contingent surplus required by present law

Senate Int 1024—Hastings, Assembly Int 572—Wadsworth, extends jurisdiction of *State Social Welfare Board* to corporations formed as *clinics or institutions*, as well as hospitals and homes for convalescent persons, and authorizes Board to bring action for dissolution of any such corporation formed without its approval.

Senate Int 1025—Hastings, Assembly Int 1272—Wadsworth, strikes out provision exempting persons on *work relief projects* under T E R A. from *workmen's compensation* provisions

Senate Int 1054—Muzzicato, Assembly Int 189—Lomis, increases from ten to thirty days the time prior to offering of a *blood donation* within which time donor must have had satisfactory physical examination

Senate Int 1055—Muzzicato, Assembly Int 1123—Phelps, Assembly Int 1204—Starkey, strikes out certain exemptions for sale of *drugs* subject to uniform narcotic drug law and provides that medicinal preparations administered, dispensed or sold, for purpose of exemption, shall contain some drug, in addition to narcotic drug, to confer medicinal qualities other than those possessed by narcotic drug alone

Senate Int 1091—Condon, Assembly Int 1416—Washburn, includes in provisions for *workmen's compensation*, employees of municipal corporations and other political subdivisions

Senate Int 1103—Page, Assembly Int 1426—Brees, exempts from provisions of *license to practice medicine*, physicians or surgeons employed in *U S Veteran's Administration* while engaged in performance of duties

Senate Int 1110—Condon, Assembly Int 1419—Washburn, provides that *medical bureaus and laboratories* denied license for treatment and care of injured employees, on failure to receive approval by medical society or board, shall have the right to appeal to industrial council within sixty days after application has been filed, and authorizes removal from approved list of physicians who fail to submit full and truthful medical report to employer, and makes other changes

Senate Int 1139—Desmond, Assembly Int

1452—Lonis, prohibits operation of *slaughter-houses* outside of New York City without license by agriculture commissioner for annual license fee of \$5 00, except farmers who butcher their own domestic animals or fowls on their farms, makes it unlawful to slaughter, sell or possess unwholesome meat or to feed hogs the uncooked offal from slaughter-houses, and appropriates \$5,000

Senate Int 1140—Desmond, Assembly Int 1451—Lonis, authorizes agriculture commissioner, for prevention of *trichinosis*, to require that persons manufacturing, selling or delivering articles of food containing muscle tissue of pork customarily eaten without cooking, shall process such food as prescribed by Agriculture Department

Senate Int 1141—Desmond, Assembly Int 1455—Lonis, extends to February 15, 1942, time for report of *temporary state commission* studying problems of *trichinosis* and other diseases contracted by eating infected meat, and appropriates \$7,500

Senate Int 1195—Young, Assembly Int 1641—Milmoë, provides that violations of Medical Practice Act shall be heard by subcommittee of the *Committee on Grievances* in Education Department and report adopted by a two-thirds vote of full committee shall be transmitted to the Board of Regents for approval and final determination (Unanimous vote has been required up to present time)

Senate Int 1378—Condon, requires that education boards and school district trustees shall provide *school children* with *health and welfare services and facilities*, and that public welfare districts and towns shall provide children who attend private schools with similar services and facilities

Senate Int 1382—Mahoney, Assembly Int 1730—Mailler, continues for another year the *commission* created to *formulate a long-range health program*, and appropriates \$75,000

Senate Int 1383—Crawford, provides that Education Department, on recommendation of board of examiners for *nurses*, may issue without examination a *license* to person who has certain qualifications and meets certain conditions

Senate Int 1796—Coudert, Assembly Int 2019—Olliffe, authorizes New York City superintendent of *schools* to require that *employees* shall submit to medical examination by physician or school inspector, to determine mental or physical capacity to perform duties

Senate Int 1817—Page, provides that on recommendation of Board of Nurse Examiners, Education Department may *license* as registered professional *nurse* any person who has graduated from school of nursing in United States with course of at least two years' duration in general hospital, who meets age, character and citizenship requirements and has been engaged in practice of nursing in this state for five years prior to July 1, 1938, or for ten years prior to that date, five years of which shall have been in the state

Senate Int 1913—Hampton, provides *medical expense indemnity* or *hospital service corporations* may, with approval of insurance superintendent, *invest* in real property required for principal office, but not to exceed 3 1/2 per

cent of net premium income during preceding twelve months

Assembly Int 167—Quinn, permits disclosure by physicians and nurses of *professional information* when such information is subject of legislative investigation

Assembly Int 930—Mitchell, provides that person who willfully violates or refuses to comply with *lawful order* or *regulation* prescribed by local *board of health* or *health officer* is guilty of an offense, instead of a misdemeanor

BILLS DEFEATED

Senate Int 153—Farrell, Assembly Int 15—Ferri, providing for taking *testimony* of *physician* or *nurse* who rendered services to party in an action in New York City municipal court, by commission instead of subpoena. Died in Codes Committee in Senate and Judiciary Committee in Assembly

Senate Int 154—McCaffrey, Assembly Int 140—McCarron, allowing treatment by *public hospitals* of *workmen's compensation* cases Died in respective Labor Committees

Senate Int 274—Muzzicato, Assembly Int 318—Catenaccio, authorizing *New York City* to acquire site for building *general hospital* Passed Senate, died in Assembly Rules Committee

Senate Int 313—Gutman, Assembly Int 371—Wagner, *compulsory health insurance* Died in Insurance Committee in Senate and Ways and Means Committee in Assembly

Senate Int 521—Coughlin, Assembly Int 620—Bannigan, requiring domestic *servants* in New York City to submit to *physical examination* test for syphilis, etc Died in respective Health Committees

Senate Int 548—Gutman, authorizing *education boards* and trustees to employ psychologists, visiting teachers and social workers trained in *psychiatric social service* Died in Education Committee

Senate Int 662—Hampton, Assembly Int 1111—W. R. Williams, requiring that *police-men* injured in performance of duties receive *hospital care* during disability Lost on third reading in Senate, Assembly bill died in Rules Committee

Senate Int 736—Coughlin, Assembly Int 513—Emma, providing that *educational institutions* shall be subject to *Workmen's Compensation Law* Died in Labor Committee in Senate and Rules Committee in Assembly

Senate Int 746—Mahoney, Assembly Int 243—Crews, requiring that city education boards and school districts maintaining *vocational schools* shall provide health service facilities for pupils attending those schools Passed Senate, died in Assembly Education Committee

Senate Int 810—Burney, Assembly Int 640—Ehrlich, Assembly Int 1044—Ehrlich, providing that reimbursement by State for *home relief* paid by welfare districts shall include *hospital care* Passed Senate, died in Assembly Relief and Welfare Committee

Senate Int 829—Burney, Assembly Int 1026—Wadsworth, declaring a state policy for defense and other purposes by providing for a logical and equitable adjustment of liability

under *Workmen's Compensation Law*, etc. Passed Assembly, died in Senate Labor Committee.

Senate Int 835—McCaffrey, Assembly Int 1057—McCarron, striking out provision giving employee or carrier in *workmen's compensation* cases right to select physician to participate in *physical examination* required by industrial commissioner or board. Died in respective Labor Committees.

Senate Int 853—Wicks, providing for the licensing and regulating of *optical dispensing*. Died in Finance Committee.

Senate Int 935—Desmond, Assembly Int 1219—Peterson, providing that applicants for *licenses* as chauffeurs and operators of *motor vehicles* shall be examined by physician every three years. Died in Motor Transportation Committee in Senate and Motor Vehicles Committee in Assembly.

Senate Int 937—Desmond, Assembly Int 1220—Peterson, providing that *motor vehicle licenses* revoked or suspended two or more times shall not be restored until owner of license submits certificate of licensed physician showing physical fitness to drive. Passed Assembly, died in Senate Motor Transportation Committee.

Senate Int 953—Condon, Assembly Int 1195—Ehrlich, providing for care and treatment of injured employees by licensed *podiatrists*. Passed Senate, died in Assembly Labor Committee.

Senate Int 1074—Esquirol, includes in provisions for *Workmen's Compensation*, employment by New York City or New York City Education Boards except members of supervising and teaching staffs. Died in the Labor Committee.

Senate Int 1078—Mahoney, providing Regents may authorize board of *nurse* examiners to issue *licenses* to persons qualified because of experience and who are unable to produce records or meet requirements, preference to be given to applicants rendering nursing service without personal gain. Died in Education Committee.

Senate Int 1097—Mahoney, providing for issuance of *limited nurses' licenses* to persons who qualify as child nurses or as nurses of tuberculosis or cancer patients. Died in the Education Committee.

Senate Int 1115—Gutman, Assembly Int 1393—Wagner, creating *consumer's bureau* in the Health Department for regulation of manufacture and sale of proprietary foods, drugs or cosmetics. Died in respective Health Committees.

Senate Int 1135—Desmond, Assembly Int 1454—Lomis, creating in *Agriculture Department* a division of *meat inspection*. Died in the Agriculture Committee in the Senate and the Ways and Means Committee in the Assembly.

Senate Int 1143—Desmond, Assembly Int 1453—Lomis, providing that garbage shall be boiled before feeding to swine. Passed Senate, died in Assembly Rules Committee.

Senate Int 1145—Hammond, Assembly Int 370—Shaw, appropriating \$30,000 for suppression and control of *poliomyelitis*. Died in Finance Committee in Senate and Ways and Means Committee in Assembly.

Senate Int 1227—Gutman, Assembly Int 1268—Stemgut, gives courts of special session jurisdiction of charges for *violation of practice of chiropody*. Passed Assembly, died in Senate Education Committee.

Senate Int 1392—Esquirol, Assembly Int. 1837—Austin, providing for issuance of a *supplemental license* to a duly licensed *physiotherapist* for the use of certain *physiotherapy* modalities. Died in the respective Education Committees.

Senate Int 1532—Corning, Assembly Int 1809—Fox, providing that *fees* for *physiotherapeutic procedures* in excess of \$25, administered by physician qualified to treat by *physiotherapy* may be allowed in *workmen's compensation* cases without approval of employer. Died in Labor Committee in Senate and Rules Committee in Assembly.

Senate Int 1589—Bewley, Assembly Int 1855—Sutor, providing that in case of *death* occurring *without medical attention* the coroner may be notified as well as local health officer to investigate and certify as to cause of death. Passed Senate, died in Assembly Rules Committee.

Senate Int 1610—Mahoney, providing for *licensing certified opticians* by Education Department, on payment of ten-dollar fee with evidence of qualification and after passing examination given by board of examiners in optometry. Died in the Education Committee.

Senate Int 1686—Coughlin, Assembly Int 1966—Bannigan, requiring *domestic errands* in New York City to submit to *physical examination* including test for pulmonary tuberculosis. Died in Health Committee in Senate and Rules Committee in Assembly.

Senate Int 1692—Halpern, Assembly Int 1956—McBain, giving person on *relief* right to *select physician* within district. Died in Relief and Welfare Committee in Senate and Rules Committee in Assembly.

Senate Int 1780—Young, Assembly Int 2046—Lomis, providing that there shall be three instead of two *classes of licenses* for practice of *nursing*. Died in Education Committee in Senate and Rules Committee in Assembly.

Senate Int 1784—Riley, Assembly Int. 2070—Peterson, providing before *defendant* is sentenced for *felony* or receives suspended sentence that investigation and report shall be made by probation officer, together with physical, mental or psychiatric examination, etc. Passed Senate, died in Assembly Rules Committee.

Senate Int 1813—Riley, providing that members of *hospital house staff* shall be subject to *workmen's compensation* provisions. Passed Senate, died in Assembly Rules Committee.

Senate Int 1950—Muzzicato, defining practice of *radiology*. Lost on floor in Senate.

Senate Int 1990—Hastings continuing commission created to study facilities for care of *deaf children*. Died in Finance Committee.

Senate Int 2003—Muzzicato, physicians' and surgeons' *fee bill*. Died in the Judiciary Committee.

Senate Int 2004—Muzzicato, providing in certain civil actions for personal injuries, court may appoint one or more *physicians as expert witnesses*. Died in the Judiciary Committee.

1452—*Louis*, prohibits operation of *slaughter-houses* outside of New York City without license by agriculture commissioner for annual license fee of \$5 00, except farmers who butcher their own domestic animals or fowls on their farms, makes it unlawful to slaughter, sell or possess unwholesome meat or to feed hogs the uncooked offal from slaughter-houses, and appropriates \$5,000

Senate Int 1140—*Desmond*, Assembly Int 1451—*Louis*, authorizes agriculture commissioner, for prevention of *trichinosis*, to require that persons manufacturing, selling or delivering articles of food containing muscle tissue of pork customarily eaten without cooking, shall process such food as prescribed by Agriculture Department

Senate Int 1141—*Desmond*, Assembly Int 1455—*Louis*, extends to February 15, 1942, time for report of *temporary state commission* studying problems of *trichinosis* and other diseases contracted by eating infected meat, and appropriates \$7,500

Senate Int 1195—*Young*, Assembly Int 1641—*Milmoe*, provides that violations of Medical Practice Act shall be heard by subcommittee of the *Committee on Grievances* in Education Department and report adopted by a two-thirds vote of full committee shall be transmitted to the Board of Regents for approval and final determination (Unanimous vote has been required up to present time)

Senate Int 1378—*Condon*, requires that education boards and school district trustees shall provide *school children with health and welfare services and facilities*, and that public welfare districts and towns shall provide children who attend private schools with similar services and facilities

Senate Int 1382—*Mahoney*, Assembly Int 1730—*Mailler*, continues for another year the *commission* created to *formulate a long-range health program*, and appropriates \$75,000

Senate Int 1383—*Crawford*, provides that Education Department, on recommendation of board of examiners for *nurses*, may issue without examination a *license* to person who has certain qualifications and meets certain conditions

Senate Int 1796—*Coudert*, Assembly Int 2019—*Olliffe*, authorizes New York City superintendent of *schools* to require that *employees* shall submit to medical examination by physician or school inspector, to determine mental or physical capacity to perform duties

Senate Int 1817—*Page*, provides that on recommendation of Board of Nurse Examiners, Education Department may *license* as registered professional *nurse* any person who has graduated from school of nursing in United States with course of at least two years' duration in general hospital, who meets age, character and citizenship requirements and has been engaged in practice of nursing in this state for five years prior to July 1, 1938, or for ten years prior to that date, five years of which shall have been in the state

Senate Int 1913—*Hampton*, provides *medical expense indemnity or hospital service corporations* may, with approval of insurance superintendent, *invest* in real property required for principal office, but not to exceed 3½ per

cent of net premium income during preceding twelve months

Assembly Int 167—*Quinn*, permits disclosure by physicians and nurses of *professional information* when such information is subject of legislative investigation

Assembly Int 930—*Mitchell*, provides that person who willfully violates or refuses to comply with *lawful order or regulation* prescribed by local *board of health or health officer* is guilty of an offense, instead of a misdemeanor

BILLS DEFEATED

Senate Int 153—*Farrell*, Assembly Int 15—*Ferril*, providing for taking *testimony* of *physician or nurse* who rendered services to party in an action in New York City municipal court, by commission instead of subpoena Died in Codes Committee in Senate and Judiciary Committee in Assembly

Senate Int 154—*McCaffrey*, Assembly Int 140—*McCarron*, allowing treatment by *public hospitals* of *workmen's compensation* cases Died in respective Labor Committees

Senate Int 274—*Muzzicato*, Assembly Int 318—*Catenaccio*, authorizing *New York City* to acquire site for building *general hospital* Passed Senate, died in Assembly Rules Committee

Senate Int 313—*Gutman*, Assembly Int 371—*Wagner*, *compulsory health insurance* Died in Insurance Committee in Senate and Ways and Means Committee in Assembly

Senate Int 548—*Gutman*, authorizing *education boards* and trustees to employ *psychologists*, visiting teachers and social workers trained in *psychiatric social service* Died in Education Committee

Senate Int 662—*Hampton*, Assembly Int 1111—*W R Williams*, requiring that *police-men* injured in performance of duties receive *hospital care* during disability Lost on third reading in Senate, Assembly bill died in Rules Committee

Senate Int 736—*Coughlin*, Assembly Int 513—*Emma*, providing that *educational institutions* shall be subject to *Workmen's Compensation Law* Died in Labor Committee in Senate and Rules Committee in Assembly

Senate Int 746—*Mahoney*, Assembly Int 243—*Crews*, requiring that city education boards and school districts maintaining *vocational schools* shall provide health service facilities for pupils attending those schools Passed Senate, died in Assembly Education Committee

Senate Int 810—*Burney*, Assembly Int 640—*Ehrlich*, Assembly Int 1044—*Ehrlich*, providing that reimbursement by State for *home relief* paid by welfare districts shall include *hospital care* Passed Senate, died in Assembly Relief and Welfare Committee

Senate Int 829—*Burney*, Assembly Int 1026—*Wadsworth*, declaring a state policy for defense and other purposes by providing for a logical and equitable adjustment of liability

Courts may, in cases of "drunken drivers" admit in evidence amount of alcohol in defendants' blood

Individuals committed by court to an institution of the Mental Hygiene Department, are liable to have their driver's licenses suspended or revoked

All clinics or institutions, as well as hospitals and homes for convalescent persons, are to be placed under the jurisdiction of the State Social Welfare Department

The sale of any drugs containing opium or any of its derivatives will be restricted to prescription by a physician

Trichinosis is receiving increasing attention. The commission to study this problem has an extension of another year, with an appropriation of \$7,500. The Mailer Long Range Health Commission was continued with an appropriation of \$75,000, an increase of 30,000 over last year's amount.

Slaughterhouses outside New York City must be licensed by the Department of Agriculture and only wholesome meat may be sold, and hogs must be fed only cooked offal from slaughterhouses. Articles of food containing pork shall be properly processed.

Our Executive Officer has filed with the Governor opposition to two bills of the Department of Education, authorizing registration as professional nurses of certain persons not possessing the educational qualifications required by law, also opposition to the Quinn bill requiring physicians and nurses to divulge confidential information.

Results show that upstate legislators were more familiar with the stand of the State Medical Society on public health measures than in previous years. Evidently, the "big stick" of some of the upstate County Presidents and Secretaries has been profitably wielded.

In the downstate area the senators led us to the conclusion that not one in five had been approached by any physician relative to the merits of the radiology bill. One of the senators opposed the bill in the interests of organized labor.

This year it seemed wise to omit the introduction of the physicians' lien bill. That should come up in 1942, and very early.

Each county society can plan systematized contacts of their legislators, especially as regards the lien bill and the radiology bill.

The 1942 personnel in the Legislature probably will be the same as this year.

The Committee gave particular attention to the instruction of the 1940 House that efforts be made for repeal or amendment of the State Education Law so as to prevent use of the title of "Doctor" by those who practice chiropody (podiatry) and others of the minor subdivisions of the healing arts, and also to petition the Governor, the Legislature, and the University of the State of New York to the end that the title "Doctor" be properly safeguarded. It reported to the Council the following facts:

1. The present law, effectual as of September, 1940, does not give podiatrists the right to use the title "Doctor" but only the title "Doctor of Podiatry" to graduates in 1943.
2. The Podiatry Society of the State of New York has advised the Department of Education that it will be prepared by the year

1945, in its school, the First Institute of Podiatry of Long Island University, to increase the educational requirements for the degree of Doctor of Podiatry, from two years of college work and three years at the Institute to two years of college work and four years at the Institute—so that the title of Doctor will become a standard doctorate.

3. The Associate Commissioner of Education was very positive at the meeting in September of the representatives of Podiatry, himself and the Legislative Committee of the Medical Society of the State of New York, that with the title of Doctor being given to so many groups other than Doctors of Medicine, his department would not approve of any amendment to the law eliminating the title "Doctor of Podiatry" with the promise that such a change to standard requirements for a Doctorate were to be made. In other words, at present, he feels that the Doctorate in Podiatry is substandard and the change to 2 and 4 years, respectively, from 2 and 3 years would make it standard.

4. That, when the podiatrists amended their law in 1936 so that after the year 1940, a course would be started requiring for admission 2 years of college work and 3 years study of podiatry, and that graduates of such a course would have the right to use the title "Doctor of Podiatry," the Society through its Committee on Legislation, with the approval of the Chairmen of the various County Committees on Legislation, carefully studied and apparently approved the proposed amendment.

The Council, with these facts in mind, took formal action at its meeting on January 9, 1941, in its capacity as the ad interim administrative body of the Society charging its Committee on Legislation to take no action in this matter.

Your Committee has received increasing evidence of the recognized stability, reliability, and dependability of our Executive Officer, Dr. Lawrence, in the eyes of our legislators, especially the leaders. It should be a matter of satisfaction and congratulation.

The responses from the county societies with their offered impressions of bills have been of great help, more than ever before. Most of the physicians recognize the fact that the legislator is "on the spot" and treats him with all friendliness in personal or written contacts. Very rarely there is a doctor who writes mandatorially, with little respect and in a manner to which any self-respecting man would object. "Molasses—not vinegar!"

Dr. Lawrence advises that the best method of getting a bill before the Legislature and without expense to the doctor is to present the proposition to an Assemblyman or Senator, asking him to draft it into a bill and introduce it.

Again, we implore that the House of Delegates refrain from making any mandatory requests for specific legislation.

The Woman's Auxiliary of the State Medical Society is cooperating intelligently and tirelessly. From reports, we conclude that law opposition to health insurance bills, to the Schwert bill on physical education, and to many other undesir-

Senate Int 2106—Desmond, authorizing boards of supervisors to provide fund for paying in advance bills of committee administering *mutual self-insurance* plan and expenses of medical, hospital and similar service, for *injured employees* Died in the Internal Affairs Committee

Senate Int 2107—Desmond, providing that in case of a village participating in a *mutual self-insurance plan of workmen's compensation*, its equalized valuation shall be determined from assessments of properties within the village as they appear on last preceding assessment roll of town. Died in the Labor Committee

Senate Int 2123—Esqurol, requiring every *nursing bureau* to obtain a license from mayor or licensing commissioner of city Died in the Finance Committee

Assembly Int 62—Peterson *chiropractic bill* Died in the Rules Committee

Assembly Int 352—L Bennett, providing for *inspection of hospital records* by injured person and his attorney in actions against New York City or its education boards for damages for personal injuries Died in the Rules Committee

Assembly Int 364—Austin, prohibiting the handling of food in restaurants, etc., by person with communicable or contagious disease, and requiring *physical examination of food handlers* Died in the Health Committee

Assembly Int 442—Emma, appropriating \$750,000 for construction of *cancer hospital in Ulva* Died in the Ways and Means Committee

Assembly Int 491—Giordano, payment of funeral expenses from *life insurance* of deceased Died in the Judiciary Committee

Assembly Int 505—Austin, court to modify *hospital lien* Stricken from third reading calendar

Assembly Int 527—L Bennett, practice of *chiropractic* Died in the Education Committee

Assembly Int 574—L Bennett, requiring physicians to report cases of *infantile paralysis*, etc Died in the Ways and Means Committee

Assembly Int 612—McLaughlin, creating *commission* to make survey of *dental needs* of inhabitants Died in the Rules Committee

Assembly Int 827—Gittleson, defining as hazardous for *workmen's compensation* purposes, employment in *civil service* or *municipal corporations* Died in the Labor Committee

Assembly Int 1114—Giordano, permitting sick person receiving *relief* to *select own physician* Died in the Relief and Welfare committee

Assembly Int 1231—G B Parsons, creating *commission* to study methods and facilities for *physical education* and recreation in schools and colleges Died in the Rules Committee

Assembly Int 1335—McLaughlin, authorizing the *inspection of roadside collages* Died in the Cities Committee

Assembly Int 1475—Caffrey, creating *commission* to study and make inventory of existing and potential *food resources*, etc Died in the Rules Committee

Assembly Int 1797—Wachtel, providing that no *person handling food*, who has com-

municable disease, shall be permitted to work in factory where food is manufactured, etc Died in the Rules Committee

Assembly Int 1893—Gittleson, establishing a *statewide plan of public medicine* Died in the Ways and Means Committee

Assembly Int 2062—Austin, requiring New York City education board to establish *child guidance bureau* Died in the Rules Committee

Assembly Int 2173—Jack, requiring New York City education board to establish *staff of physicians, dentists*, etc., for periodic examination and promotion of health of *school children* Died in the Rules Committee

Final action of the Governor on bills referred to him will appear in a later bulletin from the Legislative Bureau

We are all breathing "easier" now The Legislature began a week later than in 1940, was slow in getting started, but its tempo increased to a hectic crescendo at the finish We should offer our sympathy to the legislators and our Executive Officer Our part in our respective committees was very little

It is to the credit of our legislature that they hold our *Medical Practice Act* in such high respect, blitzkrieg upon blitzkrieg on the part of chiropractors, physiotherapists, and others were repulsed successfully, *Health insurance* and *socialized medicine* were, as usual, considered and waylaid We opposed Assembly Int 167—Quinn, permitting a legislative investigation to hear *testimony from doctors and nurses* engaged in hospital work This bill alone was passed over our opposition, but it is likely the Governor will veto it The *radiology bill* was only introduced on March 25th, by Senator Muzzicato The senator is a physician, has a personal interest, and is supposed to have introduced the bill of his own accord In fact, he reintroduced Senator Desmond's bill of last year This bill was lost in the Senate, with opposition especially strong from the labor lobbyists Only two of New York County's nine votes were in favor, only one of Kings' eight was affirmative with two recorded as absent, all three senators from the Bronx were opposed, and of Queens, one was for and one against the bill Richmond County had one vote and that one for the bill The Senator had never been contacted by a physician, other than by Senator Muzzicato who sat next to him in the Senate

We receive condemnatory letters sometimes We did in connection with the radiology bill The doctor did not even know that it had been introduced

Suppose the doctors in Greater New York were to interview their senators and assemblymen early and find out if they will favor a bill which the radiologists want to have passed If they find sufficient support, it is recommended that they introduce the bill early in the coming January—otherwise there is no hope

The amendment to the Medical Practice Act was passed It will increase the efficiency of the Grievance Committee, despite the fact that it was further amended before passage "A part of a loaf is better than none"

Voluntary health insurance corporations must hire solicitors for subscribers by salary, not by commission

I believe from my association with the work of the New York Office that, while much has been accomplished, further savings and efficiency are possible. I am convinced, moreover, that the progress which has been made is due largely to the work of the Council *Committee on Office Administration and Policies*. It would be unfortunate to interrupt this work, and my first recommendation to the House of Delegates is that this body be continued and its composition and form retained, for this includes representation from the secretarial, editorial, business, and financial elements of your organization. This committee, as a matter of efficiency and economy, should continue to be identical with the *Publication Committee*, because their interests overlap to a large degree. It might be desirable, however, to have a different trustee appointed on each committee in order to develop a wider and more intimate contact between the Board of Trustees and the Society's activities. Reports from this committee should be made to the Council, and a final report made to the House of Delegates at its annual session. I shall refer to this matter again later on and shall conclude the purely financial section of my report with a more specific analysis of the auditor's statement for the year 1940.

The income from dues (including arrears) was \$179,148. The expense of operations was \$160,165.78. This leaves apparently a surplus of \$18,982.22. Note may be taken of the expenditures. The cost of administration grossly was as follows: central office salaries (general manager and clerical force) \$32,658.51, for new furnishings \$4,511, for rent \$2,914.21, for auditing and system study \$2,100, for social security and unemployment taxes \$1,442.47, for supplies, telephone, extra stenography, postage, light, etc., \$5,676.78, for the Medical Preparedness Committee, \$1,009.58. A number of miscellaneous items make up a total of over \$51,000 for central office administration. Several of these items should not recur, e.g., outlays for new furniture, system studies, medical preparedness, but salaries constitute a continuing factor, well over \$34,000 for the general conduct of the headquarters office without those connected with publications, public relations, legislation, workmen's compensation, and the legal bureau.

In a discussion of expenditures for salaries it may be of interest to note that the total disbursements for salaries during 1940 was \$100,141.51, made up as follows: headquarters office \$34,658.61, department of publications, JOURNAL, \$16,435.50, and Directory \$5,298.10, public relations bureau \$9,774.30, legislative bureau \$13,030, workmen's compensation bureau \$7,385, bureau of scientific activities \$1,560, and legal department \$12,000.

Previous to 1940 the auditing procedures employed did not afford a satisfactory method of determining the actual expenditures for salaries. However, as nearly as I can state them, the total amount for 1939 was \$89,128.69 as compared with \$100,141.51 for the past year. In other words, about 55 per cent of the total income from dues in recent years is devoted to salaries, leaving 45 per cent for general activities. If a lowering of dues income results from a probable reduced membership during the war period and from remissions for those entering military service it will be necessary to exercise economies in various directions—a matter as I have already stated,

for future budget committees to take into consideration. However, I may well repeat that the expanding activities of recent years demand increasing expenditures and therefore continuing oversight is essential which, in my belief, can best be accomplished through the localized committee, whose continuation I am recommending in this report.

B Publications—For a period of approximately three years, your Society has published its official JOURNAL and Medical Directory. The costs are met by allotments from dues (91 cents per member for the JOURNAL and \$1.15 for the Directory in 1940) and from advertising, outside circulation, and reprints. The JOURNAL income during 1940 from these sources was \$65,561.46 and the Directory \$24,969.40. The total expense of production was \$80,952.78 for the JOURNAL and \$44,979.80 for the Directory. The net cost for the Society, therefore, was \$15,391.32 for the JOURNAL and \$20,010.40 for the Directory. The budgetary allotments were \$22,950 and \$17,000, respectively. Neither, therefore, was exceeded.

These figures are impressive, but the hope may be held out that, with the improved administration of this activity, with savings in printing costs, with the more adequate membership index which has been developed, with increasing revenue from advertising, we may expect that the Society's publication ventures will eventually return in full, or in great part, their costs. Comment must be made on the higher quality of the JOURNAL and upon its wider general distribution as compensation for the labor and effort expended. I want to call attention at this point to the devotion and hard work which has been given by Mr. Dwight Anderson to our publications. His constant association and cooperation with your Publication Committee has developed a better control and supervision over these activities than we have ever had previously.

C Public Relations Bureau—The conduct of this bureau cost the Society the sum of \$15,894.13 during 1940, thus coming within the budgetary allowance. A new phase of this work is the expanded radio program provided by a resolution of this House of Delegates. This has entailed a great deal of work and is described more fully elsewhere.

D Workmen's Compensation Bureau—Salaries took up about \$7,400 of a total of \$9,000 which this bureau cost the Society. It must be noted that the Medical Society of the County of New York appropriates an equal sum to the cost of conducting this bureau. Whether this function should be continued on the same participating basis or taken over in its entirety by the State Society and supported by contributions, in part at least, by those who receive its benefits, is a matter for future consideration.

E Postgraduate Education—Your Society's participation in this domain is limited practically to providing for postgraduate instruction and cost \$5,108.58. In view of the increasing demands made on the chairman of the committee in charge, it may become necessary to make this a remunerative post in the future. The Society cannot well afford to restrict these activities and, in a sense, this is a public health function, further contributions from State and Federal sources may prove desirable. The burden of providing such facilities should not rest entirely upon organized medicine.

able bills, has been built up by the women God bless them!

Your Committee thanks each and every one, from the President and Secretary down to the last man in the last ditch, for help, kindly guidance, support and comfort, assistance and assurance. We appreciated some fine letters of confidence.

SPEAKER BAUER If there is no objection, the supplementary report from the Council on Legislation will be referred to the Reference Committee on the Report of the Council, Part VII, Dr. Cunniffe, *Chairman*, without being read.

(There was no dissent.)

SPEAKER BAUER Hearing none, it will be so ordered.

The Chair will now recognize Dr. Kosmak, Treasurer of the Society, to present a supplementary report. (Applause)

10 Supplementary Report of the Treasurer

(Section 56)

DR. GEORGE W. KOSMAK Mr. Speaker and colleagues of the House, herewith is a supplementary report of your Treasurer which, as on previous occasions, endeavors to present a more complete statement of the Society's financial status during the past calendar year than is afforded by the auditor's formal report for this period. I also am including a partial review of those activities with which your Treasurer has been concerned by virtue of his position as a member of the Council and as Chairman of the Committees on Office Procedures and of Publication. My presentation, therefore, may overlap the reports of other constituted officers and bodies but, in the exercise of the above functions, I feel that I might be privileged to discuss them. I will consider in turn, therefore, your Society's financial status based on an analysis of the *auditor's report* for the year 1940, and refer to the work of the Special Committee on Office Administration and the activities of the Publication Committee, as these are concerned so prominently with financial matters. In conclusion there are ventured various suggestions and recommendations for your consideration and action.

A. Finances in General—In the Report of the Board of Trustees, the financial status of the Society is designated as satisfactory. This in a large sense is true. Nevertheless, it cannot be regarded so in a permanent sense in view of what may come about during the next few years, if and when this country becomes involved in the world conflict. In addition to the status of our securities, we must take into consideration primarily the effect on our income from the drainage of members' dues, for we cannot estimate definitely how many physicians from this state will be taken into military service. The allotment from New York has been stated to be as high as 2,500, of which a considerable number may be drawn from our membership. The surplus of income over expenditures to be noted in the auditor's report for 1940 may thus be eliminated during the current year, and this fact must be kept in mind by the Council Committee on Finance in the preparation of the next annual budget.

As pointed out in my previous reports, your Society has developed into a comparatively large and important business organization. A com-

parative tabulation of dues income in the last seven years may be of interest.

1934	\$131,936
1935	\$139,717
1936	\$143,090
1937	\$153,500
1938	\$157,764
1939	\$162,006
1940	\$179,148

The corresponding costs of administration were as follows:

1934	\$ 84,327 70
1935	\$131,230 20
1936	\$136,674 20
1937	\$144,472 71
1939	\$138,465 03
	(without <i>Director's</i>)
1940	\$160,165 78

The much simpler method of conducting our Society's affairs which prevailed in former years has required extensive changes and expansion of procedures. This is particularly true since we have undertaken the publication, by our own administrative staff, of the *JOURNAL* and the *Director's*. The extent of the Society's business dealings must be gauged by the fact that our organization has become involved in monetary transactions amounting annually to about \$300,000. A more complete accounting and control in the central office was, therefore, essential. The necessary steps to accomplish this involved, among other things, the engagement of a different type of auditor. The new firm, J. K. Lasser & Co., was selected because of their long experience in the particular field of office management and publications. It can be stated that the change has been satisfactory although it involved the expenditure of a considerable sum (\$2,100) in order to modernize our bookkeeping system and the compilation of membership records. Of course, this will not be a recurring expense. Our books are now conducted on an accrual instead of, as formerly, on a cash basis. However, it is now possible to have by the 15th of each month a statement of the Society's operations for the previous month and a better knowledge of the immediate financial status of its varied operations, insofar as actual receipts and disbursements are concerned.

The new auditors were likewise engaged to survey the work of the central office and to offer concrete suggestions and criticisms. These were presented in a formal report by the Committee on Office Procedures last October and further communicated to the Council at its various meetings. Included among them were centralized opening of all mail and adequate control of all cash receipts, improvements in collection methods on accounts receivable for advertising in the *JOURNAL* and *Director's*, disbursing of petty cash and postage funds, a position analysis, and other matters. There still remains, among additional changes, the need to install an effective stock inventory system for the new *Director's* when published, to perfect operation and management policies with reference to conserving employees' time, avoid overlapping and overtime work.

All, or most of the foregoing, that is to say, the proper administration of the *JOURNAL*, *Director's*, and Technical Exhibits at the annual meeting, are strictly business activities. The gross income from these sources during 1940 was over \$112,000.

haps I did not choose the right term to designate this official, I might have used "bursar," or "comptroller," or some more expressive term.

Although I still believe in the efficacy of this suggested step, my successor in office may have different ideas on the subject, and I would, therefore, recommend that the *proposed bylaw amendment* be withdrawn from action by this House and the matter be referred to the incoming Council for further discussion. This is my first recommendation.

My second recommendation is that the Council Committee on Office Administration and Policies, as already constituted, be continued and the reappointment made each year by the incoming president, including two designated trustees. This committee, as will be noted in the Secretary's and in this report, has carried out certain essential improvements in the conduct of the main office. It was made up of men familiar with the business of the latter and has combined in its work the related questions dealing with publication matters. Thus far the committee has concerned itself with the development of better accounting methods, improved filing systems for members' records, job analysis of the clerical force, with salary adjustments and other changes in office management. Ultimately this will be reflected in efficiencies and economies which can be developed in time to an even greater degree. Situations that have resulted from a rapid expansion of the Society's activities will require time for their adjustment, but sufficient progress has been made to warrant a continuance of the policy inaugurated by the appointment of this particular committee.

I feel, moreover, that the powers of this Committee on Office Procedures should be extended to include certain functions that can be disposed of effectually by a small group in intimate contact with situations that require immediate adjustment. This would include, among other matters, questions relating to salaries, to retirements, to discharge, to engagements of members of the office staff, to various publication questions relating to the *JOURNAL* and *Directory*. I believe that this course would be very helpful to both the General and Business managers and would facilitate quick action where this is demanded.

As the Committees of Office Procedures and Publication have so much in common, I would suggest that they be made up, as last year, of the same personnel, with representation of a separate member of the Board of Trustees on each. This would insure an intimate connection between the Board and these two important committees. The latter suggestion supplements my recommendation already made above.

A third recommendation suggests for your consideration the creation of a fund to be designated as the "*Library Fund*," which shall provide for the maintenance and upkeep of a reference and working library in the headquarters office. The activities of the Bureau of Public Relations, in particular, have necessitated the acquisition and purchase of various books and periodicals which essentially are the property of your Society. A budgetary allowance of \$250 was provided last year for this purpose and was slightly exceeded. In addition "exchanges" with other medical journals should likewise be deposited as well as those books which are not suitable for review through the medium of the Kings County Medical So-

ciety. Periodicals in particular should be available for comment by the responsible editor of the *JOURNAL*. All of these must be properly stored and catalogued as necessary. As a practical measure, the Trustees may be requested to designate a certain segment of our capital funds for this purpose, the income from which could be used as indicated. The budgetary allotment made to the Bureau of Public Relations for this purpose could then be eliminated and all purchases made by proper requisition through the medium of the Library Fund. The appointment of a Council *Library Committee* and a responsible librarian from the office staff may need to be considered to carry out this plan, which I submit for your consideration.

I have one final recommendation to propose for your consideration. Through my association with various welfare organizations, particularly the Physicians' Home, I have become convinced of the desirability of having organized medicine provide through its constituent State Societies, some means of *relief for physicians* incapacitated by age, infirmities, and actual poverty. There do not appear to be many such unfortunates and large funds for this purpose are unnecessary. The Physicians' Home of New York has developed certain affiliations with our State Society, its appeal for contributions voluntarily added to the bills for regular dues has met with a very satisfactory response. It is of interest to record that this appeal resulted in the collection to date of \$2,802, showing that the members of the State Society have acknowledged in a most satisfactory manner their appreciation of this activity.

I would venture the suggestion, therefore, that our State Society assume this function and that a certain small allotment of dues be made for this purpose. It would not be an unusual procedure. The State Societies of Pennsylvania, Illinois, and some others, I believe, have developed similar benevolent functions, assisted by their Woman's Auxiliaries, and I would recommend, therefore, that a special committee of three be appointed from among the membership of the incoming Council to study and report on the subject at one of its regular meetings.

In my official position as the custodian of the funds of your Society, I should perhaps have limited this supplementary report to a discussion of the dollars and cents in my charge. However, in recent years, I have come into more intimate contact with related activities in which there are important financial implications. I have endeavored to discuss some of them in this report, and trust that I may be pardoned for these excursions into allied fields. It is a pleasure to record that, on the whole, your Society is financially in a fairly sound condition insofar as expenditures are kept within the bounds of our present income. It may be said that our spending policy has been liberal, but it has contributed unquestionably to the growth and importance of our organization. Whether such liberal policies can be continued in the face of the probable inroads on our dues-paying membership by the military situation and other factors are matters to be fully considered by the incoming administration. The apparent balance last year of \$19,000 may easily be wiped out and economies in the conduct of our activities may be in order.

In closing this report, with which, as it is my

F Legal Bureau—The costs of this bureau during 1940 amounted to \$12,321 02. Although an item of considerable expense, it is an essential phase of our activities.

G Pensions—Miss Baldwin, office manager emerita, received \$3,000 during the current year, as in previous years since her retirement, by resolution of the Council. Miss Loughlin, a former bookkeeper invalided by illness, has likewise received a total of \$522 95. Your Committee on Office Procedures has made inquiries as to the possibility of developing a permanent pension system. It was estimated by one company that the total annual premium to provide a \$65 per month annuity would amount to \$5,793 77. In another company the premium asked was \$6,253. In 1940, Government taxes for social security and unemployment insurance amounted to \$2,563 37. This figure will vary each year. Employees contribute an equal sum by deduction from payrolls. Whether our employees would be agreeable to subscribing to a second insurance scheme is doubtful, and we are not, in my belief, in a position to meet the additional cost of the entire premium or the difficulties associated with administration. The Committee on Office Procedures does not recommend this measure after careful study of its implications.

H Investment Account—Your Society had on January 1, 1941, surplus funds invested in stocks, bonds, and savings banks, of a total value of over \$265,872 38. The details of these segregated funds are given in the auditor's report.

The conduct of the investment fund resides in the hands of your Board of Trustees, which has presented its own report. The total income from this source during 1940 was \$11,955 17, all of which was returned to the fund. (Idle funds in the general checking account were placed in savings banks until needed. During the year they totaled about \$24,000, yielding a return of \$389 38 in interest, which would have been wasted had these monies not been set aside temporarily.)

As already stated, unavoidable depreciation in securities has occurred again during the past year, but no further defaults have taken place in either principal or interest. Dividends have been returned on all stocks acquired since a resolution of this House gave permission to the Trustees to invest 50 per cent of the Society's funds in equities. Our financial advisers (the Chase National Bank) have counseled against the purchase of further securities during the current year, with a few exceptions, and suggested a larger cash reserve to be kept in savings banks. The latter totaled about \$39,500 on January 1, 1941. This advice is in accord with safety of conserving principal rather than securing larger interest return.

I have already referred to the considerable depreciation in market values of the securities in our investment fund. This amounted in 1940 to \$26,314 66 in bonds and \$15,098 91 in stocks, or a total of \$41,413 57, in relation to the original cost, which figure is about \$5,500 in excess of the year 1939. I will continue to believe, as I have stated on previous occasions, although my belief is not confirmed possibly by others, that we should possess reserves of at least \$400,000. The only addition during the past few years to our previously accumulated reserve is the income from securities, amounting to about \$11,000, or one-quarter of the total depreciation. The excess

of operating income over operating expenses in 1940 was approximately \$19,000, which balance is none too large to serve as a working capital. It is not practical to place it in the investment account. It is unlikely that a more favorable balance will result this year if our dues income is diminished by the force of circumstances.

The comparative values of our security holdings plus (in recent years) cash reserves in savings banks, is as follows:

1934	\$177,887 40
1935	\$186,501 88
1936	\$211,549 45
1937	\$224,148 53
1938	\$236,045 07
1939	\$229,971 00
1940	\$265,872 38

It will be noted that there is shown apparently a steady increase, but account must be taken of the fact that this is due mostly to a return of the income from interest to the principal and also to the recouping fund of approximately \$13,000 taken from current income in 1938-1939 to compensate for losses in defaulted bonds. Attention must be called to an item of \$10,000 which was paid out of capital in 1937 for the purpose of establishing the JOURNAL. This sum has not as yet been returned and is a charge against the JOURNAL when sufficient funds are available for its repayment.

I regret this somewhat pessimistic note in reference to our reserves, and I feel that they should show a more healthy growth to meet possible emergencies.

General Comments and Recommendations—

Having been honored by four successive terms in this office, your Treasurer should be permitted, at the close of his service, to present a few comments based on his experiences and observations during this period. As an elected official, charged in the Constitution and Bylaws with definite duties and responsibilities, a treasurer is apt, in time, to degenerate, unless he becomes over-conscious, into a rubber stamp, with his principal duty relegated to the signing of checks. He is an officer and not an employee. Aside from attendance at Council and Trustees' meetings, he occupies an anomalous position unless, as in this instance, he is constituted a member of special bodies such as the Council designated Committees on Office Administration and Policies, and on Publication. After he has acquainted himself with the inside workings of the administrative office, he begins to wonder how much real value he is in his honorary, and perhaps it might be called, onerous job. And when a mere practitioner of medicine is thrust into a large business organization such as your Society has grown to be, he feels very inadequate in fulfilling what should be a position of great trust. He feels, as a matter of fact, if he is to function adequately, that he should be very close to the spending mechanism. Finance committees and trustees are all very well in their way, they are supposed to control the purse strings, but in reality they have no direct and constant oversight on what comes in and what goes out. That is why in a previous report to this House of Delegates I suggested the appointment of a second assistant treasurer, who would be a full-time employee, and act as chief bookkeeper among possible other duties, and who would be an integral part of the office staff. Per-

14 Licensure—Standards for Recognition of Foreign Medical Schools

(Section 75)

DR. FLOYD S. WISLAW, *Monroe* This resolution is presented by the Legislative Committee of the State Society. It has to do with the registration of foreign physicians

"WHEREAS, any historical review of the development of medical licensure in the State of New York brings into prominent relief the important role that the Medical Society has assumed in each step of that development, the Society having initiated movements from time to time to raise the requirements for licensure with the sole objective in view to provide for the people of the State and the very best quality of medical care available, and

"WHEREAS, the existing requirements for medical licensure if properly enforced within the intent of the law will provide ample protection to the people from the ministrations of incompetent practitioners so far as any law can afford that protection, and

"WHEREAS, a student from the United States or Canada is required to present evidence that he has completed not less than four satisfactory courses of at least eight months each in a medical school in this country or Canada registered as maintaining at the time a standard satisfactory to the department or has received the degree of bachelor or doctor of medicine from some medical school in this country or Canada, registered as maintaining at the time a standard satisfactory to the department, and

"WHEREAS, a determination of the reputation and good standing of medical schools in the United States and Canada is on a sound basis by reason of periodic inspections of such schools by the Department of Education of New York State, the Council on Medical Education and Hospitals of the American Medical Association, and the requirements for membership in the Association of American Medical Colleges but the Department has available no comparable evidence with respect to medical schools located elsewhere because of the fact that no agency exists in this country which inspects or classifies such foreign schools, and

"WHEREAS, despite this lack of authentic information as to the quality of instruction given in foreign schools, graduates from such schools are in increasing numbers receiving licenses to practice medicine in New York State, and

"WHEREAS, according to the statistics furnished by the Bureau of Immigration of the United States, the influx of graduates of foreign medical schools into the United States has increased from 329 in the fiscal year ending June 30, 1931, to a total of 1,384 during the fiscal year ending June 30, 1939, making a total of 4,549 for the same period, a large majority of whom have been licensed in this and other states, and

"WHEREAS, the ethical and professional fitness of a candidate for medical licensure cannot be appraised solely on the strength of an examination but must be gaged also by the quality of instruction that the applicant

has received during his preprofessional and professional schooling, and

"WHEREAS, the foregoing situation presents a continuing menace to the health and welfare of the people of New York State and thus constitutes a problem causing great concern to the medical profession of the State, be it therefore

"Resolved by this House of Delegates

"(1) That recognition for medical licensure in New York State, whether after examination or otherwise and irrespective of the question of citizenship, of graduates of foreign medical schools be strictly in accordance with the method of recognition that is applied with respect to the graduates of medical schools located in the United States and Canada. Any other method of recognition would constitute the grossest type of discrimination in favor of foreign graduates,

"(2) That in the future recognition be accorded graduates of a foreign medical school who apply for license to practice medicine in the State of New York, only when there is in the possession of the Department evidence of the quality of instruction imparted by the school of graduation. This must be of equal quality with the evidence required of approved domestic schools. The identical standard should be applied in approving all medical schools, domestic or foreign."

SPEAKER BACER This resolution will be referred to the Reference Committee on New Business B, of which Dr. DiNatale is the chairman

15 Licensure—Full Citizenship Requirement (Section 76)

DR. JOHN T. DONOVAN, *Erie* This is from the Medical Society of the County of Erie

"WHEREAS, it has been the custom of the Education Department of the State of New York to grant medical licenses to foreign physicians, and

"WHEREAS, this practice has not been to the best interests to the general public and also to the young people of this country who have studied in our medical schools, therefore be it

"Resolved, that the Medical Society of the County of Erie go on record as being in favor of requiring full citizenship as a prerequisite for the obtaining of a medical license to practice in the State of New York."

SPEAKER BAUER This resolution will be referred to the Reference Committee on New Business B, of which Dr. DiNatale is the chairman.

16 Medical Preparedness—Deferment of Medical Students (Section 63)

DR. JOHN T. DONOVAN, *Erie* A second resolution submitted by the Medical Society of the County of Erie

"WHEREAS, medical men are necessary for the proper functioning of the Army and for the care of civilian population, and especially so during an emergency, and

"WHEREAS, the drafting of medical students would interfere with the normal training and graduation in many of them would not return

"swan song," I may have taxed your patience, I want to express my personal appreciation of the work done by your various administrative officers and the clerical staff. I may have annoyed them and at times disagreed with them, but I am pleased to acknowledge their spirit of cooperation and helpful assistance.

In an organization as large as ours, it is essential that a spirit of cooperation among its varied activities be maintained, that duties and responsibilities be clearly defined, so that smooth-working efficiency and economy be guaranteed to the membership of the Society in return for the expenditure involved. In conclusion, I want to express my appreciation of the helpful assistance of my associate, Dr Kirby Dwight, and of Dr Peter Irving and those members of the administrative staff with whom my duties have brought me into intimate and personal contact.

Summary of Recommendations —

- 1 Withdrawal of proposed amendment dealing with appointment of second assistant treasurer. Refer matter to incoming Council for study and report.
- 2 Continuation of Council Committees on Office Procedures and Publication, with indicated changes in personnel and authority.
- 3 Creation of Library Fund and provisions for maintenance of library in central office.
- 4 Appointment of Council Committee to study and report on a State Society Benevolence Fund.

SPEAKER BAUER The Supplementary Report of the Treasurer will be referred to the Reference Committee on Report of the Council, Part XII, Dr William Klein, *Chairman*.

11 Designation of Reference Committee Meeting Rooms

SPEAKER BAUER The reference committee meeting rooms are located on the third floor. As you step off of the elevator, you will see a large sign there showing the rooms to which the various committees are assigned. The Committee on Report of the President is assigned to Room 303, Council, Parts I and II, Room 302, Council, Parts III and IV, Room 301, Council, Parts V and VI, Room 310, Council, Parts VII and VIII, and Legal Counsel, Room 334, Council, Parts IX and X, Room 335, Council, Parts XI and XII, Treasurer and Trustees, Room 337, Secretary and New Business A, Room 338, New Business B and C, Room 340. Rooms 343 and 350 have the stenographers in them, and you can go to those rooms and have your reports typed. All reports and resolutions must be submitted with four copies, that is, the original and three carbon copies. When the House recesses, you can go to the third floor for your committee meetings, and I am going to ask all those who are interested in any phases of the reports or in any resolutions to present themselves before those committees so that you can give your ideas to them.

I am also going to ask all officers and members of the Council to hold themselves in readiness to appear before any reference committee, if the committee so desires.

12 Introduction of Delegates from Other State Medical Societies

SPEAKER BAUER Are there any delegates from the states of Connecticut, New Jersey, or Vermont present?

(There was no response.)

SECRETARY IRVING Apparently they have not yet arrived.

SPEAKER BAUER If anyone at any time discovers that a delegate from another State Society has shown up, I wish he would let the Chair know, so they may be properly introduced.

At this time the ordinary course of business would be the consideration of amendments to the Constitution and Bylaws which were introduced last year. However, there are several of those amendments, and if we consider them now there will be no opportunity for the introduction of resolutions before adjournment, and the New Business Reference Committees would have nothing to do during the recess. Therefore, if there is no objection on the part of the House, the Chair will postpone consideration of the amendments to the Constitution and Bylaws until the afternoon session, when it will be the first order of business. Is there any objection to such procedure?

CHORUS No!

SPEAKER BAUER Since I hear none, it will be so postponed, and taken up as the first order of business at this afternoon's session. When we recess, we will recess until 3:00 P.M.

At this time the Chair will receive resolutions. I am going to ask the gentlemen when you arise to give your name and county so that the reporter can get them into the record, and when you present your resolution please come forward so that you are facing the House, and so that we may all hear it.

13 Medical Practice Act—Definition of Word "Antiseptic"

(Section 41)

DR CHAS GORDON HEYD, New York It was to be anticipated, gentlemen, that when the Medical Practice Act, Paragraph 2, Section 1,262, was enacted, that gave certain grants of privileges to the osteopaths, some complications would arise. The term "antiseptic" was used in that amendment to the Medical Practice Act, and the osteopaths now feel that the use of the word "antiseptic" therein allowed them to use drugs for syphilis and gonorrhea, etc. Therefore, the Board of Regents and Secretary Hammond, have been confused at the lack of a proper definition of "antiseptic", hence this resolution is submitted.

"WHEREAS, the word 'antiseptic' has never been clearly defined as used in the Medical Practice Act, Paragraph 2, Section 1,262, be it

"Resolved, that for the purpose of administration the term 'antiseptic' as used in this law shall be construed to refer to a substance employed for topical applications only or to serve as a solution for the sterilization of instruments, the effect in both instances being to prevent or inhibit the growth of micro-organisms."

SPEAKER BAUER This resolution will be referred to the Reference Committee on New Business A, of which Dr Simpson is chairman.

medicine in the state with the implied or expressed promise that such fees were to be collected for a period of five years by which time the problem of the control of unlawful practice of medicine was expected to be solved, and

"WHEREAS, this annual fee has been collected annually since the effective date of the new law with no indication that it is not considered a permanent tax, and

"WHEREAS, there are no provisions or, at best, inadequate provisions for the care of indigent physicians in New York State, be it

"Resolved, first, that the Nassau County Medical Society requests an accounting of the moneys collected for annual re-registration since the effective date of the law with a statement as to how such moneys were expended, and be it further

"Resolved, second, that a sum of money be set aside from this fund to be made available to the indigent physicians of the state, and be it further

"Resolved, that a portion of the annual re-registration be henceforth allocated for such purposes, and be it further

"Resolved, that the delegates of the Nassau County Medical Society be instructed to present these resolutions to the annual meeting of the House of Delegates to the Medical Society of the State of New York to be held at Buffalo starting April 28, 1941, with the request that the Medical Society of the State of New York sponsor and seek the introduction and passage of such legislation as might be necessary to make effective the purposes of these resolutions"

SPEAKER BAUER Inasmuch as a resolution on the subject of this re-registration fee was introduced last year and referred to the Council, and the Council has reported in Part XI of the Council Report, it is believed this resolution is sufficiently related so that it should be referred to this same reference committee. Therefore, this will be referred to the Reference Committee on Report of the Council, Part XI, of which Dr Bull is chairman

21 Medical Preparedness—Funds for County Society Committees

(Section 74)

DR. THOMAS A. MCGOLDRICK, *Kings* This is from the Medical Society of the County of Kings

"WHEREAS, The American Medical Association and the Medical Society of the State of New York have agreed to assist the Federal Government in National Defense, and

"WHEREAS, this has necessitated the selection of over 2,000 physicians in New York State to work on Local Draft Boards and Medical Advisory Boards, and

"WHEREAS, selection and recommendation of physicians to serve on these Boards has necessitated innumerable telephone conferences and correspondence, and

"WHEREAS, requests are constantly being made of the County Medical Societies by both the State Medical Society and the Army as to the capability of physicians to do certain types of work, and

"WHEREAS, we are now being requested to review the records of and to certify the 4,600 doctors of Brooklyn as to their availability for military or naval service, or as to their need for the care of the civilian population, and

"WHEREAS, this is an added burden on already overburdened clerical and stenographic staffs in the County Medical Societies, therefore be it

"Resolved, that the New York State Medical Society allot sufficient funds to the County Societies to provide additional necessary clerical and stenographic help and office equipment to assist in carrying on the work of the committees on medical preparedness"

SPEAKER BAUER This resolution will be referred to the Reference Committee on New Business B, of which Dr DiNatale is chairman

22 Medical Relief—Direct Payment of Medical Fees to the Aged, the Blind, and Dependent Children

(Section 73)

DR. THOMAS B WOOD, *Kings* This is a resolution submitted by Kings County

"WHEREAS, under existing laws, it is the duty of the State to provide medical care for those persons who are unable to provide this care for themselves, and

"WHEREAS, the cost of medical care is variable and, at the present time, cannot be estimated in advance, and

"WHEREAS, under the Social Security Act payments for assistance in categories for which grants are given by the Federal Government, such as the aged, the blind and dependent children, can be made only to the recipient of this assistance, and

"WHEREAS, under this ruling physicians treating persons receiving old-age assistance, aid to the blind or aid to dependent children can no longer be paid directly by the local welfare organizations, and

"WHEREAS, physicians, nurses, appliance dealers, etc., have no accurate knowledge of when persons in these categories receive checks to pay for medical services which physicians and others have given them, and

"WHEREAS, this tends to cause additional hardship to physicians and others by either requiring them to go to the patient's home, possibly several times, to collect their fee, or to treat these patients without just recompense, and

"WHEREAS, we realize that the Subcommittee on Medical Relief of the State Medical Society, the New York State Department of Social Welfare and the New York City Department of Welfare, feel that persons rendering medical care of New York State should be paid directly but that the State could not sacrifice approximately \$900,000 in federal grants for medical care which they must sacrifice under this provision of the Social Security Act if the monies were paid to other than the recipients-of-aid in these categories, therefore be it

"Resolved that the Medical Society of the State of New York, through its delegates to the American Medical Association, request that the American Medical Association have

for the completion of the study of medicine when the course has been interrupted for one or more years, therefore be it

"Resolved, that the Medical Society of the County of Erie go on record against the drafting of medical students and also instruct its delegates to implore the Medical Society of the State of New York to do everything in its power to allow the deferment by Selective Service Boards of medical students thereby permitting them to complete their medical education, and be it further

"Resolved, that the Medical Society of the State of New York send letters to various draft and appeal boards appraising them of the gravity of the situation"

SPEAKER BAUER This resolution will be referred to the Reference Committee on New Business C, of which Dr Masterson is the chairman

17 Establishment of Section on Thoracic Diseases

(Section 44)

DR. JOHN T DONOVAN, *Erie* This is a third resolution which I would like to submit

"WHEREAS, during the past decade great advance has been made in the diagnosis and treatment of thoracic diseases, and

"WHEREAS, the profession at large is being deprived of the knowledge of this scientific achievement, and

"WHEREAS, the New York State Chapter of the American College of Chest Physicians at its annual session held in January 17, 1941, unanimously passed a resolution to petition the New York State Medical Society for the establishment of a session on thoracic disease at its annual meetings, therefore be it

"Resolved, that the House of Delegates establish a section on thoracic diseases, thus affording to the members of the State Medical Society a greater opportunity for scientific and clinical knowledge regarding this very important branch of medicine"

SPEAKER BAUER This resolution will be referred to the Reference Committee on New Business A, of which Dr Simpson is the chairman

18 Membership—Remission of Dues for Members in Active Military Service

(Section 56)

DR. JOHN T DONOVAN, *Erie* This is a resolution from the Medical Society of the County of Erie

"WHEREAS, the induction of physicians into military service removes them from their practice, and

"WHEREAS, this results in a great sacrifice to the said physician both personally and financially, therefore be it

"Resolved, that the Medical Society of the County of Erie go on record as favoring the waiving of both county and state dues of said physician while in active military service, this resolution having been discussed and adopted at the stated meeting of the Medical Society of the County of Erie held February 17th, 1941, be it further

"Resolved, that the Medical Society of the

County of Erie beg the Medical Society of the State of New York to take such action"

SPEAKER BAUER Inasmuch as there is a resolution much to the same effect in the Report of the Council, Part XII, this resolution will be referred to that committee of reference instead of to a New Business Reference Committee This is referred to the Reference Committee on the Report of the Council, Part XII, dealing with the Reports of the Treasurer and Trustees, of which Dr Klein is chairman

19 Medical Preparedness—Women Physicians for the Medical Reserve Corps of the United States Army and Navy

(Section 69)

DR. EMILY D BARRINGER, *New York* This resolution is presented by the Medical Society of the County of New York

"WHEREAS, the United States of America is at present engaged in a vast preparedness program which includes a listing of members of the Medical Reserve Corps available for active service, and

"WHEREAS, there are approximately 8,000 women physicians and surgeons in the United States—women physicians and surgeons of America demonstrated their fitness for war-time service during the First World War when they financed units and staffed hospitals with well-trained officers, in France and Serbia, and

"WHEREAS, the United States Government has to date taken no cognizance of these women physicians in time of national emergency, and

"WHEREAS, the Government has already granted women nurses Army rating with proper rank, pay, and war-risk insurance, therefore be it

"Resolved, that the Medical Society of the State of New York recommend that the women physicians and surgeons of America be made eligible for the Medical Reserve Corps of the United States Army and Navy, and be granted full privileges thereof, and be it further

"Resolved, that the Medical Society of the State of New York instruct their delegates to the House of Delegates of the American Medical Association, that this request be laid before the House of Delegates of the American Medical Association for consideration."

(Applause)

SPEAKER BAUER This resolution will be referred to the Reference Committee on New Business B, of which Dr DiNatale is chairman

20 Medical Practice Act—Annual Re-registration Fee

(Section 48)

DR. LOUIS A. VAN KLEECK, *Nassau* This is a resolution submitted by the Nassau County Medical Society

"WHEREAS, the Medical Practice Act of 1930 provides for the payment of every practicing physician of an annual re-registration fee of \$2 00, and

"WHEREAS, the medical profession was told at the time this law was proposed that the purpose of the fee is to provide the educational authorities of the state with funds with which to control the unlawful practice of

referred to the Reference Committee on New Business B, of which Dr DiNatale is chairman

27 School Health Program (Section 48)

DR. ROMEO ROBERTO, *Westchester* This is a resolution from the Medical Society of the County of Westchester, on the subject of School Health Service

"WHEREAS, the problem of school health service involves many aspects, requiring the consideration of school physicians, public health experts and experts in health education, in addition to physicians engaged in private practice, and

"WHEREAS, the tendencies and trends in the development of school health service may well determine the pattern of future medical practice, since the children of today will be the adult citizens of tomorrow, be it

"Resolved, that the House of Delegates request the Council to provide for the formation of a special committee or commission, representative of school physicians, private physicians and experts in health education, and charge this commission with the duty of studying further the school health program of this state and formulating, as promptly as possible, a practical program of action in answer to the following question

"What changes are needed in law and in administrative practice to place the school health service upon a sound economic and professional basis, to equip the school physician for leadership in health education, to correlate the school health program with the educational program as a whole, and to correlate the school health service with the official health agencies and the medical profession in the community?"

SPEAKER BAUER This resolution will be referred to the Committee on New Business A, the reference committee of which Dr Simpson is chairman.

28 Leaves of Absence for Officers in Military Service (Sections 66, 79)

DR. THEODORE WEST, *First District Branch* I wish to introduce this resolution

"WHEREAS, many officers of this Society and of its District Branches are also officers in the Medical Reserve of the armed forces of the United States, and

"WHEREAS, such officers, when called to active duty, may, by reason of distance or the press of military work, be unable to function properly as officers of this Society or its District Branches, and

"WHEREAS, there is no provision in the present Bylaws of this Society to cover such an emergency, therefore be it

"Resolved that any officer of the Medical Society of the State of New York or its District Branches who is called into active service with the armed forces of the United States may, upon application to the Council, be granted leave of absence during his period of active service, and be it further

"Resolved, that during such absence his duties shall be delegated as the Council may

direct except where such delegation is already provided in the Bylaws"

SPEAKER BAUER That involves an amendment to the Bylaws, and cannot therefore be referred to a reference committee, but will have to be held over until next year

29 Invitation to American Medical Association to Hold Its 1944 Annual Meeting in New York City (Section 70)

DR. A. M. HELLMAN, *New York* This concerns the 1944 meeting of the American Medical Association

"WHEREAS, the 1940 Annual Meeting of the American Medical Association was a great success in New York City, therefore be it

"Resolved, that the Medical Society of the State of New York extend an invitation to the American Medical Association to hold its 1944 Annual Meeting in New York City"

SPEAKER BAUER That resolution will be referred to the Reference Committee on New Business B, of which Dr DiNatale is chairman

30 Advertising in Newspapers—by Physicians (Section 61)

DR. SAMUEL M. KAUFMAN, *New York* This resolution is presented from the Medical Society of the County of New York

"WHEREAS, Governor Lehman recently signed the Milmoie Bill which limits drastically commercial displays and flagrant advertising by licensed podiatrists in the State of New York, and

"WHEREAS, the dental profession previously succeeded in bringing about legislative enactment which reduced advertising abuses in the dental profession, therefore be it

"Resolved, that the House of Delegates of the Medical Society of the State of New York go on record as disapproving all advertising in newspapers by practicing licensed physicians of the State of New York, individually or in groups, in the form of announcing their office address, office hours, kind of practice or particular cure to the public, and further be it

"Resolved, that the House of Delegates instruct the Committee on Legislation of the New York Medical Society to take any action necessary to amend the present law to this effect"

SPEAKER BAUER That is referred to the Reference Committee on New Business C, of which Dr Masterson is the chairman

31 Medical Preparedness—Deferment of Medical Students (Section 62)

DR. M. E. MARSLAND, *Westchester* This comes from the Medical Society of the County of Westchester

"WHEREAS, the experience of belligerent nations in the World War and in the present conflict amply demonstrates the necessity for insuring a continuing supply of well-trained medical graduates, and

"WHEREAS, the United States Army in 1917-1918 permitted medical students on active service to be transferred to the Reserve for the purpose of completing their medical

legislation initiated to provide a change in the Social Security Act so that persons rendering medical care to recipients-of-aid from any government agency may be paid directly by that agency."

SPEAKER BAUER This resolution will be submitted or referred to the Reference Committee on New Business B, of which Dr DiNatale is chairman

23 Medical Relief—Direct Payment of Medical Fees to the Aged, the Blind, and Dependent Children

(Section 73)

DR HOWARD FOX, New York This resolution from the New York County Society is very much like the last one, and perhaps goes to show that other men in different parts of the state feel similarly

"WHEREAS, after April 1, 1941, checks from the Department of Welfare of the State of New York (Q V Form M med 383 b) for the Medical Care of those patients entitled to Old Age Assistance and Blind Assistance will be issued directly to the recipients of the care and not to the doctors rendering it, and

"WHEREAS, this forces the physician to collect these fees from indigent people who may be unreliable, therefore be it

"Resolved, that the Medical Society of the State of New York go on record as being opposed to the proposed change in method of payment, and that the Society request the Department of Welfare to continue its former method of paying these physicians directly"

SPEAKER BAUER This resolution will be referred to the same committee as the previous one, Reference Committee on New Business B, of which Dr DiNatale is chairman

24 Health and Accident Insurance for Interns

(Section 42)

DR ABRAHAM KLEIN, Kings This is the resolution I wish to introduce

"WHEREAS, hospital interns spend some of the best years of their lives in caring for the sick at very little or no compensation, and

"WHEREAS, the risk of infection or injury to hospital interns is very great, and

"WHEREAS, many hospital interns in the past have become disabled for life through accident or illness, therefore be it

"Resolved, that the Medical Society of the State of New York recommend to the New York State Legislature that a bill be introduced making it obligatory for hospitals in New York State to provide health and accident insurance for interns serving in their hospitals"

SPEAKER BAUER That resolution will be referred to the Reference Committee on New Business A, of which Dr Simpson is chairman

25 Medical Preparedness—Foreign Service of American Physicians

(Section 60)

DR LAURANCE D REDWAY, Westchester I wish to introduce this resolution

"WHEREAS, the President of the United States, on April 17, 1941, has, as President of the American Red Cross, endorsed the appeal of the British Red Cross for one thousand young American physicians, and

"WHEREAS, the American Medical Association, in an editorial in the *Journal of the A M A* has 'assured Britain of every possible assistance,' and has supplied the Red Cross with lists of eligible young doctors, thereby endorsing the principle that American physicians be encouraged to volunteer for foreign service, and

"WHEREAS, of the 5,000 annual graduates of American medical schools only 3,000, or 60 per cent, are physically acceptable for military service and available to meet the demands of an expanding military establishment, thereby necessitating substantial requisitions from the ranks of those now in private practice in addition to depriving the civil population of 50 per cent of the new graduates, and

"WHEREAS, the maintenance of those standards of military and civil health, made possible by the thorough education and training of the American Physician and now demanded by the people of the United States, is vital to the defense of the nation and the welfare of its population, therefore be it

"Resolved, that the Medical Society of the State of New York instruct its delegates to the A M A to propose, by resolution or otherwise, that the American Medical Association immediately state its policy with respect to further depletions of the reservoir of available young American physicians in the event of further requisitions of volunteer medical personnel emanating from a foreign source"

SPEAKER BAUER That resolution will be referred to the Reference Committee on New Business C, of which Dr Masterson is chairman

26 Corporate Practice of Medicine

(Section 71)

DR. ANDREW A EGGSTON, Westchester The resolution I wish to introduce concerns the Corporate Practice of Medicine, and is as follows

"WHEREAS, the practice of medicine or of any other profession by a corporation is advisedly prohibited by most of the states of the union, and

"WHEREAS, New York State now authorizes the formation of nonprofit corporations in the field of voluntary health and medical expense insurance, a development which may ultimately be extended to the authorization of the virtual practice of medicine by commercial as well as nonprofit corporations, and

"WHEREAS, proponents of radical innovations in the practice of medicine are known to be seeking means of breaking down or of circumventing present legal obstacles to the outright or disguised practice of medicine by corporations, therefore be it

"Resolved, that the House of Delegates request the Council to designate a committee to study the present laws and precedents in New York State relating to the corporate practice of medicine, this committee to be charged with the continuing duty of studying and periodically reporting to the House of Delegates and to the Society its findings and recommendations, with a view to preventing the destruction or circumvention of legal safeguards against corporate practice in New York State"

SPEAKER BAUER That resolution will be

they would go to a dinner tonight if such were held. Are there any who were not asked that question, and who would be interested in going?

About 25 so indicated

SPEAKER BAUER Apparently there are over 100 who would be willing to go. We will make a definite announcement about that dinner at the opening of the afternoon session as to the time and place. I think it will be in the Georgian Room, which I believe is on the mezzanine floor, but we will make a definite announcement as to that at the afternoon session, and we will try to make it as reasonable as possible.

The Secretary informs me that some of the delegates have not turned in their credentials. Will you please do so, when you leave this session at the registration desk?

When we recess, we will recess until 3 00 P M in this room.

Are there any other announcements to be made?

(There was no response)

SPEAKER BAUER If not, I will declare the House recessed until 3 00 P M.

(At 12 30 P M. a recess was taken)

Afternoon Session

April 28, 1941

The session convened at 3 05 P.M., pursuant to recess

SPEAKER BAUER The House will be in order

34. Constitution and Bylaws—Amendments

SPEAKER BAUER As announced this morning, the first order of business this afternoon will be consideration of the amendments to the Constitution and Bylaws which were proposed last year.

I will ask the Secretary to read the proposed amendments that have been submitted and have been on his desk for the past year, and which have been published once in accordance with the Bylaws. I think it will facilitate an understanding of these amendments if the ones pertaining to changes of dues and the fiscal year are read *in toto*, then we will take up the various sections individually. I think they will be a little clearer if the whole amendment is read right through to start with.

A. Change of Dues Year and Fiscal Year

SECRETARY IRVING The first amendment under "A," change of dues year and fiscal year, I will not read the introduction unless you especially want it.

SPEAKER BAUER Yes, I think it would add to the understanding of the proposed amendment by the House.

SECRETARY IRVING This appears on page 45 of the Annual Reports which have been distributed to you, if you want to follow along with my reading of it.

This has to do with change of the Dues Year and Fiscal Year so that both shall coincide with the Calendar Year. Previous to 1939 the Dues Year had been the Calendar Year while the Fiscal Year had begun July 1 and ended June 30 of the succeeding year. In 1939, the House of Delegates had retained the Fiscal Year from

July 1 to June 30, but changed the Dues Year to coincide with the Fiscal Year. Because this was found impractical, particularly as related to the change in the Dues Year, the Council submitted an amendment in 1940 so that both Dues Year and Fiscal Year shall hereafter coincide with the Calendar Year, as follows:

Chapter V—Board of Trustees, Section 2—

Change last sentence by deleting words "July 1," and "June 30 of the following year," and inserting the words "January 1" and "December 31 of each calendar year" making it read:

"The fiscal year shall begin January 1 and end December 31 of each calendar year."

Chapter I—Membership, Section 2—Change (a), last sentence, by deleting the words "July 1 to June 30 of the succeeding year," and inserting the words "January 1 to December 31 of each year," making it read:

"The dues year shall coincide with the fiscal year, January 1 to December 31 of each year."

Chapter I—Section 2—Change (b), first sentence, by deleting the words "December 31," and inserting the words "May 31," making it read:

"A member whose dues and assessments are unpaid after May 31 of any current year is not in good standing."

Change (c) by deleting the words "June 30," and inserting the words "December 31," making it read:

"A member whose dues and assessments are unpaid after December 31 of any current year shall automatically be dropped from the rolls of membership of both county and state societies, without notice to such member by "

Delete (d), which now reads "The change of the dues year shall first become operative."

Change (e) by deleting the words "May 1," and "Ensuing fiscal" and inserting the words "November 1," and "succeeding," making it read:

"Dues and State assessment of a member elected or reinstated after November 1 shall be credited to the succeeding year, all rights and privileges of membership, however, dating from the time of election."

B Amendment of Previous Amendment. This was notice that the Medical Society of the County of Kings had resolved to amend the preceding amendment, Chapter I, Section 2 (e), to make that portion read:

"Dues and State assessment of a member elected or reinstated after October 1 shall be credited to the succeeding year, all rights and privileges of membership, however, dating from the time of election."

SPEAKER BAUER These amendments are now before you for your approval, or disapproval, or amendment.

DR. WALTER D LUDLUM, Kings I think the last amendment should be considered first and by itself, because if that is passed it will supersede part of amendment "A."

SPEAKER BAUER That is very true. I was going to take them in serial order, and when we came to that one, Section 2 (e), was going to consider the amendment first.

DR. LUDLUM Very well, but as long as I am on my feet, so that I may not have to ask for the

course, on application to and approval by the Surgeon General, therefore be it

"Resolved, that the Medical Society of the State of New York instruct its delegates to the American Medical Association to introduce a resolution, memorializing the Surgeon-General to give consideration to similar action with respect to medical students inducted into active service in the present emergency."

SPEAKER BAUER Inasmuch as there are two resolutions of somewhat similar tenor already referred to the Reference Committee on New Business C, of which Dr Masterson is chairman, this resolution will also be referred to that reference committee

32 Hospital Construction—Federal Bill

(Section 45)

DR. JOHN L. BAUER, Kings I have been asked to present the following resolution

"The Medical Society of the State of New York is informed that the Senate Committee on Education and Labor, of which Senator Mead is a member, has under consideration S 1230, the Hospital Construction Bill introduced by Senator Brown of Michigan. The Society, through its proper committee, has carefully studied the bill and wishes to file with Senator Mead certain objections to it in its present form

"1 It objects to the inclusion of an osteopath on the national advisory hospital council. This designation seems unnecessary, for no hospital would be created for that form of treatment alone since it is only a specialized form of treatment, and if specific forms of treatment are to be recognized, other cults may naturally seek designation,

"2 The bill seems to provide that only projects constructed within the first year shall be supervised by the advisory council. Other projects conceivably will be constructed in later years and the advisory council's authority should be extended to cover these also,

"3 The definition of the term 'hospital' in Section 18 is so worded as to permit of the construction, equipment, and operation of health, diagnostic, and treatment centers without specifying that there must be available bed capacity. Every hospital should be equipped to provide diagnostic laboratory service and to provide treatment for ambulatory cases, but the government would be defeating its one purpose of spreading medical service if it engaged in constructing health centers where free diagnostic and treatment services would be obtainable. Private physicians not employed in the centers would be unable to compete with the government centers

"Realizing Senator Mead's interest in matters of this character, it is suggested that the House authorize that this communication be sent to him with the request that he give it careful consideration, and if a hearing is held on the bill, that it be spread upon its minutes."

SPEAKER BAUER That is referred to the Reference Committee on New Business A, of which Dr Simpson is the chairman

Are there any other resolutions?

(There was no response.)

SPEAKER BAUER Dr Irving has a couple of communications

33 Medical Relief—Direct Payment of Medical Fees to the Aged, the Blind, and Dependent Children

(Section 73)

SECRETARY IRVING These communications are both on the subject of the direct payment of medical fees to recipients of certain categories of relief. These letters have been sent to the central office, one from Broome County Society and the other from Wyoming County Society.

The following communication is from the Broome County Society

"The matter of direct payment to physicians by recipients of old-age assistance was brought before our Medical Society at the meeting held April 10. After considerable discussion, the following resolution was passed

"That the Broome County Medical Society objects very strongly to the present method of paying doctors for care of old-age and blind recipients of relief, and that this Society go on record as above, and that a copy of this motion be sent to the Secretary of the State Medical Society and that it be read at the meeting of the State Society in Buffalo."

The resolution passed by the Wyoming County Medical Society at its meeting held on April 9 reads

"It was voted that the Society go on record as being opposed to the new method of paying medical fees directly to old age relief cases and that the Board of Trustees of New York State Medical Society be notified of this action."

SPEAKER BAUER Those two communications will be referred to the Reference Committee on New Business B, of which Dr DiNatale is the chairman

If there are no other resolutions, the Chair will recognize Dr Heyd.

EXECUTIVE SESSION

DR. CHAS. GORDON HEYD, New York. Mr Speaker, I would like the courtesy of the House of Delegates to move that the House of Delegates go into executive session, the House being purged of all other than delegates, and that no stenographic record be made of the proceedings while in executive session.

DR. CLARENCE G. BANDLER, New York. I second that motion.

There being no discussion, the motion was put to a vote, and was unanimously carried.

SPEAKER BAUER The House will go into executive session, and the Chair will appoint Colonel Wentworth as sergeant-at-arms, and two husky assistants, Dr Towne, of Saratoga and Dr Brennan, of Kings.

(The House went into executive session at 11 45 A.M.)

When the House went into open session at 12 25 P.M., the following announcements were made

Announcement of various reference committee meetings before the afternoon session

SPEAKER BAUER Most of you were asked whether you would be interested in attending a delegate's dinner this evening, which would be purely informal, between the afternoon and the evening sessions. So far 87 delegates have said

joined session Tonight's and tomorrow morning's will be other adjourned sessions

Is there any further discussion on this amendment?

There were calls for the question, and the motion was put to a vote, and was unanimously carried

SPEAKER BAUER The amendment to Chapter II, Section 3, has been adopted

The next amendment that we will consider is to Chapter III, Section 1, so that it will read

"The Officers, members of the Council and of the Board of Trustees of the Society, and the Delegates to the American Medical Association shall be elected as the first business of the last scheduled session of the annual meeting of the House of Delegates"

Are there any questions or discussion on that amendment?

DR. WALTER D. LUDLUM, Kings Mr Speaker, while I do not oppose the amendment, I should like to raise a question as to the wording of it. I hate to get to my feet on a technicality like this, but this amendment provides that a certain thing shall be the first order of business on the last scheduled session, and the next amendment to be acted upon provides that something else shall be the first order of business on the last scheduled session. How can you have two firsts that are not the same thing?

SPEAKER BAUER I think you are right, but if you will read the present Bylaws you will find that they read practically the same in that respect, and these were merely copied from them, with no change of verbiage on the point you raise.

DR. LUDLUM Yes, that is true, but the first amendment provides that the election shall be the first order of business, while the second amendment provides that the nominations shall be the first order of business. I think it should be made clear as to what we mean, and both sections reconciled.

SPEAKER BAUER Nomination is ordinarily a part of the election, but I agree it is rather clumsy the way it is now worded.

SECRETARY IRVING Can you have an election without a nomination?

SPEAKER BAUER Not very well!

DR. LUDLUM I am only talking about the wording and not about the facts.

DR. KIRBY DWIGHT, New York I would suggest the insertion of the words "nomination and election" in both places.

DR. LUDLUM Yes, that will do it.

SPEAKER BAUER It has been suggested that "nomination and election" be inserted in both amendments. The question is first on that amendment. Is there any discussion on that?

DR. LOUIS A. VAN KLEECK, Nassau "Last scheduled session" are the words that are used in the amendments, and refer to tomorrow morning's session?

SPEAKER BAUER Yes.

DR. VAN KLEECK Tomorrow morning's session is an adjourned session, is it not?

SPEAKER BAUER Yes, but the way the constitution now reads it provides that "The first order of business on the second day of the session of the House of Delegates of each annual meeting shall be the nominations," which would mean that if we change the order of business so

as to make it unnecessary to have a night session on Monday, as has theretofore been the case, there would be only two sessions on Monday and two on Tuesday, and it would, therefore, put the election over until Tuesday afternoon instead of Tuesday morning with the amendment.

DR. VAN KLEECK I understand it now.

SPEAKER BAUER The question first is on the proposed amendment of inserting the words "nomination and election" in both proposed amendments to Chapter III, Section 1, and Chapter III, Section 4. Is there any discussion on that?

The question was called for, and the amendment was put to a vote, and was unanimously carried.

SPEAKER BAUER We will now have the question on the adoption of the amended amendments. The first one, covering the amendment to Chapter III, Section 1, I have read, and as you have just voted to amend it, it will read

"The Officers, members of the Council and of the Board of Trustees of the Society, and the Delegates to the American Medical Association shall be nominated and elected as the first business of the last scheduled session of the annual meeting of the House of Delegates"

Is there any discussion on that?

The question was called for, and the motion was put to a vote, and was unanimously carried.

SPEAKER BAUER The amendment to Chapter III, Section 1, is adopted.

Now we have the amendment to Chapter III, Section 4, which amounts to the same thing. It merely appears in a different place in the Bylaws, and that also has now been amended by the insertion of the words "nominations and elections," so that as it is proposed to you for vote it now reads

"The first order of business at the last scheduled session of each Annual Meeting of the House of Delegates shall be the nominations and elections for officers of the Society"

Is there any discussion on that?

The question was called for, and the motion was put to a vote, and was unanimously carried.

SPEAKER BAUER The amendment to Chapter III, Section 4, is adopted.

D. Expenses of District Branch Presidents Attending the House of Delegates as District Delegates. **SECRETARY IRVING** Dr Theodore West of Westchester County introduced the following amendment at the 1940 House of Delegates to amend Chapter X, Section 1, by insertion of an additional sentence after the fifth sentence to read

"Presidents of the District Branches sitting in the House of Delegates shall be allowed necessary expenses"

SPEAKER BAUER That amendment is before you for adoption. Is there any discussion on it?

The question was called for, and the motion was put to a vote, and was unanimously carried.

E. Duties of Officers (Sections 10, 36) **SECRETARY IRVING** The next amendment, Mr Speaker, on the list of amendments was put in by Dr George W Kosmak. As I understood

floor again, let me say why we proposed that amendment of the previous amendment. The argument of Kings County Society, which I think should apply to the other societies as well, is that a reinstatement after November 1 is of small value and is of little advertising value to the Society to secure reinstatement. The county society meeting is held on the Third Tuesday, and after the Third Tuesday of November there is very little of the year left. If we can offer them the value of the remaining year from the Third Tuesday of October it will be a much stronger advertising point, and the county society and the State Society will lose very little by the contribution that we make in that way. I think that is the argument that our society has for October 1 instead of November 1.

SPEAKER BAUER I take it you move the adoption of the amendment to Chapter I, Section 2 (e), as proposed by the Medical Society of the County of Kings.

DR. LUDLUM Yes.

DR. JOHN L. BAUER, Kings I second that amendment.

There being no discussion, the motion was put to a vote, and was unanimously carried.

SPEAKER BAUER We will now consider the amendments as a whole. Inasmuch as these amendments to Chapter V, Section 2, and Chapter I, Section 2, (a), (b), (c), (d), and (e) as amended, are all closely interrelated, and one can hardly be adopted without the others, I will entertain a motion that they be considered in one motion. Is there any objection on the part of the House to handling them in that manner?

There was no dissent.

SPEAKER BAUER Hearing none, you have the motion to adopt the amendments to the Constitution and Bylaws as listed in "A" on page 45, and as amended by "B," appearing on the same page, which you have already adopted, before you. In other words, this changes the dues year and the fiscal year to January 1 to December 31 as the dues year formerly was prior to two years ago. Are you ready for the question?

The question was called for, and the motion was put to a vote, and was unanimously carried.

SPEAKER BAUER I declare Amendments "A" and "B" adopted.

C House of Delegates—Rearrangements of Sessions **SECRETARY IRVING** Now we come to Section C of these amendments entitled "Rearrangements of Sessions of the House of Delegates."

This amendment was presented to the 1940 House of Delegates by Dr. Peter Irving, General Manager, reading as follows:

Chapter III, Section 4, the first sentence shall be altered by the substitution of the words "last day" for the words "second day" making the first sentence of Section 4 read

"The first order of business on the last day of the session of the House of Delegates of each annual meeting shall be the nomination for officers of the Society and other members of the Council, a member of the Board of Trustees, delegates to the American Medical Association, and the ap-

pointment of a sufficient number of tellers by the Speaker."

The House instructed the Council to reword this amendment in order to clarify its meaning. Thus the Council has done, at the same time taking cognizance of notice of an amendment by Dr. Arthur J. Bedell that would add a new Section to Chapter II of the Constitution to the effect that

"No new resolution may be presented on the last day of session of the House of Delegates without a two-thirds affirmative vote."

These two amendments have been fitted together by the Council with the full approval of Dr. Bedell, and the result follows:

Chapter II, Section 3, add three additional sentences, instead of adding a new section, to read

"At least thirty (30) days before the Annual Meeting of the House of Delegates, the Speaker shall announce a schedule of the adjourned sessions of the House of Delegates. This schedule may be amended by the House of Delegates during its convention. No new resolution shall be introduced at the last scheduled session except by a two-thirds vote of the House."

Chapter III, Section 1, to effect the purpose of the amendment to Chapter III, Section 4, it was found necessary to change the first sentence of this Section by deleting the words "second day's," and inserting the words "last scheduled," making it read

"The Officers, members of the Council and of the Board of Trustees of the Society, and the Delegates to the American Medical Association shall be elected as the first business of the last scheduled session of the annual meeting of the House of Delegates."

Chapter III, Section 4, change the first sentence of this Section by deleting the words "on the second day of the session of the House of Delegates of each Annual Meeting," and inserting the words "at the last scheduled session of each Annual Meeting of the House of Delegates," making it read

"The first order of business at the last scheduled session of each Annual Meeting of the House of Delegates shall be the nominations for officers of the Society."

SPEAKER BAUER The purport of these amendments is perfectly clear to everyone in the House, or would they like any further information? If not, you have them before you for consideration. We will take up first the amendment to Chapter II, Section 3, which would add the following to that section:

"At least thirty (30) days before the Annual Meeting of the House of Delegates, the Speaker shall announce a schedule of the adjourned sessions of the House of Delegates. This schedule may be amended by the House of Delegates during its convention. No new resolution shall be introduced at the last scheduled session except by a two-thirds vote of the House."

Is there any discussion on the amendment?

DR. HARRY ARANOW, Bronx That word "adjourned" sessions is not quite clear to me.

SPEAKER BAUER The original session of the House of Delegates is, for example, the one we had this morning. This afternoon is an ad-

MEDICINE This insurance must be considered from the following viewpoints

- 1 It must be nonprofit
- 2 It should involve cash indemnity and not medical service
- 3 Patients must have absolute freedom of choice in selecting a duly qualified physician from all those qualified to practice and willing to give service within the locality covered by the operation of the company
- 4 No third party may be permitted to come between the patient and his physician in any medical relation. The method of providing service must retain a permanent confidential relation between patient and physician
- 5 The fees should not be below those of the workmen's compensation schedule, but there must be no interference with higher fees being charged the higher income groups
- 6 All features of medical service must be under the control of the medical profession, such control to be exercised by or under the direction of the Medical Society of the State of New York or one of its component county societies
- 7 The eventual aim of any plan should be to cover medical care in the office, home, and hospital.

Your reference committee feels, however, that active propaganda in placing these principles before the medical and lay public is an urgent need and would recommend that the special subcommittee continue its study of this phase of their report and advise as to its possible solution. Your reference committee observed that much discussion has brought this subject to the attention of the lay public and the public is becoming Medical Indemnity Expense Insurance minded.

While there are many in the low-income working population groups who are interested in the prepayment for adequate medical care and provisions for cost of serious catastrophic illness, yet, it is the opinion of the reference committee that the medical profession has not as yet sufficiently supported any plan. Without such medical support, all plans will fail. Your reference committee, in offering this comment, is fully aware of the lack of insurance experience along these lines and urges an active attitude by the profession. This, too, should be studied by our subcommittee and, if possible, concrete recommendations should be advanced. Continued sacrifices on the part of the medical profession will be the means of obtaining the needed actuarial data. Exploitation of the physician should, however, be avoided.

A cold analysis of this situation has been described on page 717 of the April 1, 1941, number

- 1 First and foremost, the people of the United States have always been able to secure medical attention from practicing physicians whether they had the money or not. It may be that of all the necessities that the human must have, he can secure the religious service and medical care easiest and most certain of all. Someone must pay for food, housing, fuel, clothing, and hospitalization, but practically every patient without cash can secure adequate medical care. Therefore it

does not appear to the prospective patient that he is so much in need of insurance to pay the cost of medical care

- 2 Many people of the low-income group feel that they can afford to buy only one, either a hospital, or medical care, insurance contract. Most patients will feel that if they can have their hospital care provided, they will find a physician to take care of them. They fully intend to pay for both, but the experience of the public has been that they may later on pay for medical care while hospital care is often a proposition where payment is demanded a week in advance. This statement is made with no reflection on hospital methods inasmuch as hospitals, to maintain themselves, must receive revenue. The same may be said of physicians, but the physician has much more personal relationship with the patient than does the hospital
- 3 There are many who, having a regular small amount of cash, prefer to buy life insurance with this amount. There is, of course, no argument against proper protection with life insurance. It may be that after all other bills, especially those incidental to the immediate death, are paid, that some part of such fund may be used for payment of medical care. There is again no reflection on the insured, custom has decreed quite well the relative order in which those funds will be used. It takes salesmanship and some persuasion to sell even small amounts of life insurance
- 4 Advertisement by means of the personal agent, radio, and printed word offers strong inducement to the apparently well person to spend his or her money for the thousand and one necessities and luxuries of our everyday life. This competition is quite too strong to allow a universal system of saving money to pay for medical care when no signs or symptoms of illness appear on the horizon. In fact, this competition has gone to the point where the individual has borrowed and is considerably in debt for many of the things he claims to own. It is manifestly quite difficult to lay aside money for medical care when the installment payments are pressing. Those who press for installment payments have a more successful way of achieving their ends than do those who would make the health consideration of the individual their first object
- 5 The American, having been accustomed rather to employ independently his physician, looks somewhat askance at these plans for medical expense indemnity insurance, asking the questions: Am I sure to get the doctor of my choice? Is this a panel system? Are the physicians going to be interested when working on a group basis? Are inexperienced people experimenting with our medical care? When the corporation grows, will it gain some political manipulation within and without? The answers to these questions may be easily made when the method of procedure adopted by the New York State Medical Society is understood, but it will take

him this morning, it was to the effect that he wished to withdraw that amendment

SPEAKER BAUER The amendment is before the House. It can only be withdrawn by motion.

DR. WALTER D. LUDLUM I move that out of deference to Dr. Kosmak, who introduced the amendment, that the amendment be withdrawn.

DR. SAMUEL B. BURK, New York. I second that motion.

SPEAKER BAUER Is Dr. Kosmak here?

DR. KIRBY DWIGHT, New York. No, he just stepped out of the room for several minutes.

SPEAKER BAUER I think it might be courteous to wait until he returns before we take action on the withdrawal of that amendment, so he can speak on it himself, and if there is no objection we will pass that over temporarily and come back to it when he is here.

Continue, please, Mr. Secretary!

F. Jurisdiction of Board of Censors. **SECRETARY IRVING** Dr. Peter Murray of New York County introduced the following amendment at the 1940 House of Delegates to amend *Chapter VI, Section 2*, by repealing and deleting therefrom the second sentence of said section beginning with the words "Any member," and ending with the words "component county society" and enacting and inserting, in lieu thereof, the following:

"Any member of any component medical society who shall have been disciplined or directed to suffer discipline in any degree by any final decision of his county medical society and who shall have exhausted his right of appeal, if any, with any such county medical society, feeling aggrieved by the decision of such society, may appeal to the Board of Censors of this Society from the decision of such component medical society by filing a notice of appeal with the Secretary of this Society and with the Secretary of such component medical society within three months after such final decision by such component medical society."

SPEAKER BAUER Is there any discussion on that?

The question was called for, and the motion was put to a vote, and was unanimously carried.

SPEAKER BAUER The amendment to Chapter VI, Section 2, is adopted.

Has Dr. Kosmak come in yet?

CHORUS No.

SPEAKER BAUER While we are awaiting his return, the Chair will listen to reference committee reports.

Is any reference committee ready to report?

35 Report of Reference Committee on Report of Council—Part V—Medical Expense Insurance

DR. SAMUEL B. BURK, New York. The Subcommittee of the Council Committee on Public Relations set up in 1939 to study and advise on Medical Expense Insurance was continued by the Council and consisted of Herbert H. Bauckus, M.D., Buffalo, *Chairman*, Walter T. Dannreuther, M.D., New York, and William Hale, M.D., Utica. Their report has been approved by the Council.

A comprehensive review of the present status of the problem of medical expense insurance is

presented in a monograph of almost four thousand words. Since it contains data of vital economic and sociologic significance, your reference committee recommends that every member of the Medical Society of the State of New York become acquainted with its content.

Your reference committee has assiduously studied this report and wishes to direct your attention to the following:

The subcommittee approved Recommendation IV on a General Program of Medical Care of the policy of the House of Delegates of the American Medical Association at a special meeting in 1938 and held that hospital service insurance should be a community project. Plans appertaining to hospital service insurance and group hospitalization plans should confine themselves to hospital facilities and not include any type of medical care. In the opinion of the reference committee local health needs should be the guiding factor in the formulation of such plans, since conditions locally vary not only in this state but in all states throughout the United States.

Cash indemnity insurance can and should be developed to cover in whole or in part the costs of emergency and prolonged illness. We wish to emphasize that all agencies set up to approve such insurance should comply with State statutes and regulations to insure their soundness and financial responsibility. Their approval by county medical societies is of importance. In this connection, your reference committee takes cognizance that the local medical societies should act in an advisory capacity with the State Insurance Department and State Department of Welfare in an effort to eliminate groups with inferior standards for medical care. The welfare needs of the public should be the sole and only guide.

The subcommittee reiterates the stand of organized medicine that compulsory health insurance is a complicated bureaucratic system which would increase government costs and thereby raise taxes. More significant, it would lend itself to political control and manipulation. Your reference committee takes this opportunity to stress these thoughts.

Your reference committee, in agreeing that illness arising purely in and out of the course of employment, is, of course, subject to the sound principles of the Workman's Compensation Law, recommends that all necessary precautions should be taken to segregate carefully such cases from those which are not directly associated with employment thereby eliminating an entering wedge for the justification of placing all illness under the Workman's Compensation Laws. These features of the report must be emphasized.

The 1939 Enabling Act (Article IX-C) which brings into legal being the nonprofit cash indemnity insurance plans, allows a liberal interpretation by the constituted authorities (State Insurance Department and the State Department of Welfare) yet, as previously stated, the county medical societies representing the medical profession could and would be useful in an advisory capacity.

Your reference committee wishes to record the approval of the "Tentative Basis and Suggestions for Medical Expense Indemnity Insurance," which appears on page 716 in the April 1, 1941, issue of the NEW YORK STATE JOURNAL OF

worthwhile and more likely to bring about results than a larger group

The need of better dental care during the school age has again become evident in the examination of the present Selective Service for Defense. Therefore, the forming of a *committee of medical men and dentists* is most timely. The medical group should include at least one pediatrician

This same Selective Service has brought to the fore the need of more and better eye care. A survey of the eyesight of all school children in our state is certainly important and should be made by ophthalmologists and made at once

Therefore, the reference committee recommends that the Council be instructed by this House of Delegates to continue its efforts along the present lines to the end that doctors be put in charge of health and health problems among children of school age, eventually bringing back to the Department of Health the health of our school children, because this is certainly where it belongs, and Health Education should be continued under the guidance of educators, whether lay or medical.

I move the adoption of the report

DR. VINCENT S. HATWARD, Bronx. I second the motion.

There being no discussion, the motion was put to a vote, and was unanimously carried.

SPEAKER BAUER: Thank you, Dr. Hellman! The Chair recognizes Dr. Chas. Gordon Heyd, Chairman of the Committee on Lucien Howe Prize.

38. Report of Committee on Prize Essay Awards

DR. CHAS. GORDON HEYD, New York. Mr. Speaker and Members of the House of Delegates, the Lucien Howe Prize Committee consisted of Dr. Conrad Berens, Dr. John E. Scarff, and myself.

There were three essays submitted that in the opinion of the examiners were of outstanding merit. The first, and it was first in the unanimous opinion of the three men, was an original contribution on "Surgical Interruptions of the Paludofugal Fibres." The synonym was "Abbot Martino Fontana, Florence, 1781."

SPEAKER BAUER: The Secretary will open the envelope at this time and reveal who the author actually is.

SECRETARY IRVING: This is a sealed envelope, with the motto on the outside, and the name of the author inside, which I will now open. The name is H. Russell Meyers, of Brooklyn, New York.

DR. HEYD: The second paper in order of merit was entitled "Choroidosis Centralis Serosa." The synonym was "Quot homines, tot sententiae."

SPEAKER BAUER: The Secretary will open the envelope at this time and reveal who the author of that paper is.

SECRETARY IRVING: Dr. Walter F. Duggan, of Utica, New York.

DR. HEYD: I believe I should make honorable mention of the third paper on "Repair of Recent Lid Lacerations (Anagnostikus)," which was of outstanding merit, but the two previously quoted received the highest awards, as I said, from all of the examiners.

SECRETARY IRVING: The author of the third paper is Dr. Henry Minsky, of New York.

SPEAKER BAUER: Thank you, Dr. Heyd! I

am sure the House congratulates these gentlemen on having received these awards.

Is any other reference committee chairman ready to report?

39. Report of Reference Committee on the Report of the Council—Part IV—Publications, and Medical Publicity

PUBLICATIONS. DR. ARTHUR F. HEYL, Westchester. The information given under this heading in the Annual Report of the Council is indeed gratifying. No words of this committee can fully acquaint you with the mass of detail, magnitude of the task, or manner and method of co-operative procedure which enabled the Publication Committee so ably and economically to produce the JOURNAL and the *Diretory* which is in the process of compilation.

In his report to the Council, dated February 28, 1941, the Business Manager stated that for the six months then last elapsed, the net cost of the JOURNAL was \$6,465.58 less than the proportionate budgetary allowance, and that a comparison of 1939 and 1940 calendar year audits, after adjustments for comparison, showed an improvement in net cost of \$12,048.13.

This Publication Committee of five, consisting of the General Manager, Dr. Peter Irving, the Business Manager, Mr. Dwight Anderson, the Literary Editor, Dr. Laurance D. Redway, the Representative of the Trustees, Dr. Thomas M. Brennan, and the Treasurer of the Society, Dr. George W. Kosmak, deserves the complete support and commendation of this House of Delegates and the 17,694 members of the Society here represented. The high quality of the editorials, scientific papers, new arrangement of material and recently included sections on Therapeutics, Diagnosis, and Pathology, have elevated the value of the JOURNAL as a whole. As individual physicians, we should become better acquainted with what comes to us twice monthly in our JOURNAL, and take some measure of pride in the fact that it is the largest state medical publication and is received by more physicians in the United States than any other except the *Journal of the American Medical Association*.

The work of the Publication Committee would have been greatly curtailed without the invaluable contributions of Dr. Peter Irving as Managing Editor of the JOURNAL. Furthermore, in a great measure the success of the JOURNAL is due to the splendid editorials of Dr. Laurance D. Redway and his indefatigable study of general public affairs as well as medical problems.

The diversified knowledge thus gained is necessary for such excellent editorial work. Dr. Redway's native interest in radio coupled with a desire to coordinate editorial activities with the public relations work of the Society conspired to make his voluntary services in the perfection of radio programs for the Society extremely valuable.

Matters relating to publications are technical, specialized, and can be thoroughly known only by those who have been long associated with actual production of texts, books, magazines, and technical journals. Your committee, therefore, believes that it is economically essential, justly fair and in a sense a reward for effort and achievement, that this Publications Committee of five be continued in office.

Your Reference Committee on the Report of

time before the public will have full confidence in these plans

- 6 When business is good and people generally are working, the worker has little trouble in paying for medical services and he will not worry much about this when he and his family are well. When he is out of work, then will arise the difficulty of securing funds to pay for medical insurance premiums

Again the reference committee recommends that the various modalities for the education of the public be used

An erudite discussion of the alleged fallacy of compulsory health insurance as a replacement of nonprofit medical expense insurance was undertaken by our Council subcommittee and this presents a basis for considerable thought

While it is true that medical expense indemnity insurance is comparatively new, your reference committee feels that every effort should be made to bring it into practical being as promptly as is possible. On the other hand, your reference committee agrees that any plan per se cannot overcome poverty, and in accord with the opinion of the subcommittee the medical profession is ready to stand by to give every economic strata of our population the best and most modern medical care available. It is the feeling of the reference committee that every county medical society should and must attempt some solution of this pressing problem. In conclusion, your reference committee believes that the subcommittee has clearly and concisely spread itself on the record so that each local community will have specific principles to guide it. The subcommittee is to be congratulated

This report is signed by myself as *chairman*, John T. Donovan, Erie, Emul Koffler, Bronx, Andrew Sloan, Oneida, and Scott L. Smith, Poughkeepsie

I move the adoption of this report

DR. KIRBY DWIGHT, *New York*. I second that motion

There being no discussion, the motion was put to a vote, and was unanimously carried

36 Constitution and Bylaws—Amendment

E Duties of Officers (*Sections 10, 34*)

SPEAKER BAUER Dr. Kosmak, while you were out of the room, we were considering the amendment to the Constitution and Bylaws which you proposed last year in connection with Chapter VII, by the insertion of a new section, 10-A, to read

"An assistant to the Treasurer shall be appointed annually by the Council at its organization meeting, who shall serve and be subject to the supervision and order of the Treasurer, shall be adequately bonded, have no voice or vote in any meeting, shall be suitably remunerated through an order of the Council and be empowered to sign checks in special rotating funds to be set up as needed by the Trustees"

Dr. Irving stated that he believed you wished to withdraw the motion

DR. GEORGE W. KOSMAK Yes

SPEAKER BAUER A motion was, therefore, made that the amendment be withdrawn, but as you were out of the room we felt it was courtesy

to permit you to speak, if you so desired, before acting upon it

DR. KOSMAK I included that recommendation, Mr. Chairman, in my report, and I think the reference committee will bring that up in due time

SPEAKER BAUER Yes, but we have the specific amendment to act upon at this time

DR. KOSMAK I move it be withdrawn

SPEAKER BAUER It has already been moved and seconded that it be withdrawn. Is there any discussion on it?

The question was called for, and the motion was put to a vote, and was unanimously carried

SPEAKER BAUER The amendment is withdrawn

Has any other reference committee chairman a report to present at this time?

37 Report of Reference Committee on Report of Council—Part III—School Health Program

DR. ALFRED M. HELLMAN, *New York*. The Committee on Public Health and Education has continued its good work and rendered through the Council a very satisfactory report which your reference committee wishes herewith to praise. The efforts being made are along correct lines. We wish to repeat that medical work in schools should be in the keeping of properly trained graduates in medicine working either under the Board of Health or, if independently, they should be responsible to no lay group or individual except to the Department of Education itself

School Health Service should provide the best type of Health Service for all children of school age. The child should be impressed with the fact that the best type of medical care can only be obtained under the supervision of a doctor of medicine. The teaching of health measures should be done by the trained teacher, lay or medical

To accomplish this object there need be no serious change in the state's setup, but there should be a separation of the Division of Health and Physical Education into two departments, each directly responsible to the Department of Education. (1) Health, and (2) Physical Education. To have a physical educator over an M.D. must fail to give the best results. The doctor must decide which child shall take the full physical education program, and which child may indulge in only limited physical activities, and to what extent

The work and actions of Dr. Hambrook are especially noteworthy. His minority report to the Board of Regents as against the rest of the Regents' Advisory Council was much along the lines here set forth, and this suggests, therefore, that the Medical Society should be given greater representation on the Regents' Advisory Council

The Council rightly went on record as opposed to the Schwert Bill—a Federal bill which would interfere with states' power in such matters. Health is universally needed but to obtain it different localities, because of different climates, different homes from which the pupils come, require different regulations and easier methods of change as conditions warrant. Health needs are not static

The appointment of a small subcommittee to concentrate on a School Health Program is

adoption of the Report of the Reference Committee on Medical Publicity

DR. SAMUEL E. APPEL, *Dutchess* I second the motion to adopt the report of the Reference Committee on Medical Publicity

There being no discussion, the motion was put to a vote, and was unanimously carried

SPEAKER BAUER Now you have before you the motion to adopt the report as a whole

There being no discussion, the motion was put to a vote, and was unanimously carried

SPEAKER BAUER Thank you, Dr Heyd

40 Report of Reference Committee on Report of Council—Part VIII—Medical Preparedness

DR. JAMES R. REULING, JR., *Queens* The committee consisted of myself as chairman, Romeo Roberto, Albert G Swift, Thomas B Wood, and Warren Wooden

Your reference committee has read, studied, and digested that part of the report of the Council having to do with Medical Preparedness. We have nothing but approbation for the work of the committee consisting of Drs Bauer, Wentworth, and Kopetzky, and the effective organization that has been set up under its chairman, Dr Kopetzky

Your committee commends the component county medical societies and their duly elected officers for their whole-hearted and efficient co-operation in mobilizing the profession in their respective communities

The various suggestions that have been advanced for taking care of the practice of those physicians who are absent because of their military service have been carefully scrutinized and your committee takes pleasure in endorsing the Bauer or some similar plan as the most feasible one to cover the situation.

We concur with the committee's aim that the alien physician and the foreign graduates licensed to practice in this state be treated on a basis of equality with the American doctor before the law in regard to commissions and in regard to military service, otherwise it would be an injustice to our native graduates of American colleges, as they would be called to duty, and their practice would be left to the alien physician and graduates from foreign medical schools. Manifestly, this is an injustice to the patriotic native American graduate of an American school.

The committee, therefore, recommends that the delegates to the American Medical Association be instructed to introduce a resolution in that body calling upon the proper governmental agency to treat these adopted citizens and also graduates of foreign schools on terms of equality with our own graduates who are native-born citizens, so that the regulations will not work out to the detriment of the graduate of an American school.

I move the adoption of the recommendation and the report as a whole

DR. THOMAS B WOOD, *Kings* I second that motion

SPEAKER BAUER You have before you the report of the reference committee, which contains one specific recommendation for memorializing the American Medical Association. Is there any discussion on it?

The question was called for, and the motion was put to a vote, and was unanimously carried.

41 Report of Reference Committee on New Business A—Medical Practice Act, Definition of Word "Antiseptic"

(Section 13)

DR. LEO F SIMPSON, *Monroe* On the resolution introduced by Dr Heyd, of New York, reading

"WHEREAS, the word 'antiseptic' has never been clearly defined as used in the Medical Practice Act, Paragraph 2, Section 1262, be it

"Resolved, that for the purpose of administration the term 'antiseptic,' as used in this law, shall be construed to refer to a substance employed for external application only, or to serve as a solution for the sterilization of instruments, the effect in both instances being to prevent or inhibit the growth of microorganisms"

Your reference committee recommends this resolution be adopted and presented to the Board of Regents of the University of the State of New York.

DR. WALTER P ANDERTON, *New York* I second the motion.

SPEAKER BAUER You have before you the report of the reference committee, which carries with it the recommendation for the adoption of the resolution and its presentation to the Regents. Is there any discussion?

The question was called for, and the motion was put to a vote, and was unanimously carried

42 Report of the Reference Committee on New Business A—Health and Accident Insurance for Interns

(Section 24)

DR. LEO F SIMPSON, *Monroe* On the resolution presented by Dr Abraham Klein, of Kings, reading

"WHEREAS, hospital interns spend some of the best years of their lives in caring for the sick at very little or no compensation, and

"WHEREAS, the risk of infection or injury to hospital interns is very great, and

"WHEREAS, many hospital interns in the past have become disabled for life through accident or illness, therefore be it

"Resolved, that the Medical Society of the State of New York recommend to the New York State Legislature that a bill be introduced making it obligatory for hospitals in New York State to provide health and accident insurance for interns serving in their hospitals"

Your reference committee recommends that this subject be referred to the Council for study and for such action as may be deemed wise, and I so move

DR. JOHN T DONOVAN, *Errie* I second the motion.

There being no discussion, the motion was put to a vote, and was unanimously carried.

43 Report of the Reference Committee on New Business A—School Health Program

(Section 27)

DR. LEO F SIMPSON, *Monroe* On the resolution presented by Dr Romeo Roberto, of the Medical Society of the County of Westchester, reading

"WHEREAS, the problem of school health service involves many aspects, requiring the

the Council, Part IV, Publications, recommends this, and moves the approval of this recommendation.

DR. MAURICE J. DATTELBAUM, *Kings* I second that motion.

There being no discussion, the motion was put to a vote, and was unanimously carried.

DR. HEYL The *Directory* speaks for itself every time it is used, and by some of us this is frequently. It justifies its cost of about ninety-five cents for each member, and this may be reduced in subsequent issues. The criticism related in the Council report regarding the alphabetical inclusion of New York City and its boroughs is under consideration by them, and your Reference Committee on the Report of the Council—Part IV—Publications, for the convenience of those with conditioned reflexes, recommends a combination of the older method and the Council's suggestion, namely, that New York City and each of its boroughs be listed alphabetically after Manhattan, and grouped in the front of the *Directory*.

Mr Speaker, I move the approval of this recommendation.

DR. GEORGE F. BAHR, *New York* I second the motion.

There being no discussion, the motion was put to a vote, and was unanimously carried.

DR. HEYL Your committee further recommends that the *Directory* be alphabetically thumb-indexed or, if this is too expensive, that some method be evolved and included in the new *Directory* of rendering the alphabetical listing of physicians and communities more easily available.

Mr Speaker, I move the approval of this recommendation.

DR. SAMUEL E. APPEL, *Dutchess* I second that motion.

There being no discussion, the motion was put to a vote, and was unanimously carried.

DR. HEYL Mr Speaker, I move the adoption of this report on Publications, as a whole.

DR. JOHN L. BAUER, *Kings* I second it.

There being no discussion, the motion was put to a vote, and was unanimously carried.

Medical Publicity DR. HEYL This title embraces many projects radiating from the office and personage of the Director of the Public Relations Bureau, Mr Dwight Anderson. As Business Manager of the JOURNAL, *Directory*, and Technical Exhibits in the annual meetings, he is provided with integrated contacts, interests, and personalities which enrich the more highly coordinated execution of all public relations problems. The effect of the above statement is evident in the Council's report where specific instances of broad interest and importance are mentioned. It is obvious, as the report so creditably informs us, that the Director alone could not have accomplished so much in the past year without the aid and support of the various members of the Publication Committee mentioned above and the use of ideas, special articles, editorials, and projects which were suggested or developed by individuals from the Society at large who are not a component part of the Public Relations Bureau.

Thus, by many well-timed releases to the public press from JOURNAL editorials, by cooperating in obtaining the publication of certain special

articles, such as one in the *Journal of Living* by Dr Samuel J. Kopetzky, answering one by Hon. Robert Wagner, Jr., and by the publication and distribution of pamphlets such as "Give the Doctor a Break," by Dr Floyd Burrows, much has been done to provoke thinking by the public in terms of the practice of medicine and their individually related family physicians.

The further development of "Club Talks," suggested by Mr James E. Bryan, Executive Secretary of the Medical Society of the County of Westchester, who assisted in the preparation of some, supplied "ready-made" informative essays for luncheon groups, women's clubs and civic organizations throughout the state on such subjects as "Pneumonia and the Common Cold," "Rheumatic Heart Disease," etc.

Credit again should be given to Mr Dwight Anderson for his book *What It Means to Be a Doctor*, which had a widespread distribution throughout the United States, and for a companion book soon to be published, and for so ably addressing the Michigan State Medical Society in September, 1940, on public relations.

Finally, the Council reports on the invaluable research in connection with *Broadcasting* which was conducted by the Bureau of Public Relations and the Council Committee on Medical Publicity. Dr Frederick M. Miller, Sr., Dr Francis N. Kumball, and its chairman, Dr Floyd S. Winslow, before they fulfilled the mandate of the House of Delegates to engage in radio activities.

The depth and significance of this foundation research are detailed in Bulletins Nos. 37 and 38, Radio, 1 and 2, "The Doctor Takes to the Air," and "Doctors for Defense." Many of you have read these bulletins and appreciate the necessity of this preliminary work for which the Service Bulletin of the Federal Radio Education Committee has the highest praise. Criticisms from this bulletin appear on page 10 of the current Annual Reports.

The fruit of these labors is the first series of dramatized programs, "Doctors for Defense," which many of you have heard on Wednesday nights from 10:00 to 10:30 over Station WMCA, "First on Your Dial." Other thought-provoking series for the public will follow.

It is noteworthy that the script of these dramatizations will be available on loan for general use elsewhere in the United States through the Educational Radio Script Exchange, United States Office of Education, Washington, D. C. It is even probable that this program will become national after an experimental demonstration to determine the degree of audience response.

Thus, by publications, editorials, and their releases, pamphlets, books, special articles in national magazines, club talks, and, at long last, by radio, the JOURNAL, the Public Relations Bureau and the Council Committee on Medical Publicity have charted their course, set their sails. May we all man the capstan to heave anchor with them as they begin their voyage into the troubled waters of these times.

Mr Speaker, I move the adoption of this report on Medical Publicity and of the Report of your Reference Committee on the Report of the Council—Part IV—as a unit.

SPEAKER BAUER We will take them up separately. First, you have before you the

This designation seems unnecessary, for no hospital would be created for that form of treatment alone since it is only a specialized form of treatment."

Paragraph 3 to be modified in phraseology to read as follows

"The definition of the term 'hospital' in Section 18 is so worded as to permit of the construction, equipment and operation of health, diagnostic and treatment centers without specifying that there must be available bed capacity. Such centers, we believe, without available bed capacity would not constitute a hospital."

If Dr. Bauer will accept these changes, which do not modify the essential intent of the resolution, your committee recommends its adoption.

DR. JOHN L. BAUER, *Kings* Yes, I will accept the changes

DR. SNIPSON I so move

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried

46 Report of Reference Committee on the Report of the President

(Section 7)

DR. JOHN B. D'ALBORA, *Kings* Your Reference Committee on the Report of the President has read the report of his stewardship during the past year with a great deal of satisfaction. It is brief and to the point. It has a ring of sincerity, the sort of valedictory one would expect from Dr. James M. Flynn. He expresses his thanks to the Council, the several committees, the general manager, executive officer, counsel, and the director of publicity and office personnel, for their "loyal and willing service" throughout the year and for making his task "easy and altogether pleasant." Characteristically, Dr. Flynn takes no personal credit for the many accomplishments of his administration. We approve most heartily of his final word of caution. "We must remain ever watchful if we wish to maintain our present tried and true progressive system of caring for the health of our people."

Your reference committee also has studied the supplementary report of the President of providing greater support in funds and personnel to the Committee on Public Health and Education, and expresses the hope that means may be found to carry out this suggestion.

This report is signed by myself as chairman, Stephen H. Curtis, *Rensselaer*, Howard Fox, *New York*, Leon M. Kysor, *Steuben*, and Merwin E. Marsland, *Westchester*.

I move the adoption of the report

DR. MERWIN E. MARSLAND, *Westchester* I second the motion.

There being no discussion, the motion was put to a vote, and was unanimously carried

SPEAKER BAUER Thank you, Dr. D'Albora!

47 Report of the Reference Committee on Report of the Council—Part XI

Motor Vehicle Drivers—Medical Examination
DR. HARRY S. BULL, *Cayuga* Your reference committee approves of the report in its entirety, with the exception of that paragraph which begins "Regarding drunken drivers." We recommend that this portion of the report be referred

back to the committee for further study and recommendation. I so move

DR. EMILY D. BARRINGER, *New York* I second the motion

SPEAKER BAUER You have before you the report of the reference committee which recommends approval of that section of the report except the paragraph pertaining to drunken drivers, which is to be referred back to the Council. The motion is on the adoption of the committee's report. Is there any discussion on it?

The question was called for, and the motion was put to a vote, and was unanimously carried

Deaf and Hard of Hearing
DR. HARRY S. BULL, *Cayuga* The committee approves of this section of the report. We would recommend that the Committee on the Deaf and Hard of Hearing of the State Medical Society be continued for further study of this problem. We make this recommendation in view of the fact that the commission, which was formerly a state commission, has now been discontinued, therefore, we recommend that the committee which is functioning in the State Society be continued.

SPEAKER BAUER Do you make that as a motion?

DR. BULL Yes

DR. STANLEY C. PETTIT, *Richmond* I second that motion

SPEAKER BAUER You have before you the motion of the chairman of the reference committee, which approves the report of the Council pertaining to the Deaf and Hard of Hearing, and recommends the continuance of the State Society's committee on that subject. Is there any discussion on it?

The question was called for, and the motion was put to a vote, and was unanimously carried

Medical Practice Act—Enforcement.
DR. HARRY S. BULL, *Cayuga* We approve the report of the committee, and recommend that further annual reports on the workings of the Medical Practice Act be made to the House of Delegates from year to year. I move its adoption.

DR. KENNETH F. BOTT, *Greene* I second the motion

SPEAKER BAUER You have heard the report of the reference committee chairman recommending that further reports from year to year be made on the Medical Practice Act Enforcement. Is there any discussion on it?

The question was called for, and the motion was put to a vote, and was unanimously carried.

Elchacker as New York Telephone Company
DR. HARRY S. BULL, *Cayuga* Your reference committee approves the report of the committee as submitted. I move its adoption.

DR. STANLEY C. PETTIT, *Richmond* I second the motion

There being no discussion, the motion was put to a vote, and was carried unanimously

Basic Science Law
DR. HARRY S. BULL, *Cayuga* Your reference committee approves the report of the committee as presented in the annual report. I move its adoption.

DR. EMILY D. BARRINGER, *New York* I second the motion

consideration of school physicians, public health experts and experts in health education, in addition to physicians engaged in private practice, and

"WHEREAS, the tendencies and trends in the development of school health service may well determine the pattern of future medical practice, since the children of today will be the adult citizens of tomorrow, be it

"Resolved, that the House of Delegates request the Council to provide for the formation of a special committee or commission, representative of school physicians, private physicians and experts in health education, and charge this commission with the duty of studying further the school health program of this State and formulating, as promptly as possible, a practical program of action in answer to the following question

"What changes are needed in law and in administrative practice to place the school health service upon a sound, economic and professional basis, to equip the school physician for leadership in health education, to correlate the school health program with the educational program as a whole, and to correlate the school health service with the official health agencies and the medical profession in the community?"

your reference committee disapproves this resolution because there is already in existence a subcommittee of the Council Committee on Public Health and Education, which is called the Subcommittee on School Health Program, which is at present devoting itself solely to the study of these problems

Your committee recommends that this resolution be disapproved, and I so move

DR LEO F SCHIFF, *Clinton* I second that motion

SPEAKER BAUER You have before you the report of the reference committee, which recommends that the resolution be disapproved. The question is on the adoption of the committee report, which carries with it the loss of the resolution. Is there any discussion?

The question was called for, and the motion was put to a vote, and was carried

44 Report of Reference Committee on New Business A—Establishment of a Session on Thoracic Diseases

(Section 17)

DR. LEO F SIMPSON, *Monroe* On the resolution presented by Dr John Donovan, of the Medical Society of the County of Erie, reading

"WHEREAS, during the past decade great advance has been made in the diagnosis and treatment of thoracic diseases, and

"WHEREAS, the profession at large is being deprived of the knowledge of this scientific achievement, and

"WHEREAS, the New York State Chapter of the American College of Chest Physicians at its annual session held in January 17, 1941, unanimously passed a resolution to petition the New York State Medical Society for the establishment of a session on thoracic disease at its annual meetings, therefore be it

"Resolved, that the House of Delegates establish a session on thoracic diseases, thus affording to the members of the State Medical So-

cety a greater opportunity for scientific and clinical knowledge regarding this very important branch of medicine,"

your reference committee recommends to the Committee on the Scientific Program that at the 1942 Meeting of the Medical Society of the State of New York, it consider the incorporation of a symposium on thoracic diseases. I so move, Mr Speaker

The motion was seconded by several, and as there was no discussion, it was put to a vote, and was unanimously carried

45 Report of Reference Committee on New Business A—Hospital Construction Federal Bill

(Section 52)

DR. LEO F SIMPSON, *Monroe* On the resolution introduced by Dr John L Bauer, for the Medical Society of the County of New York, reading

"The Medical Society of the State of New York is informed that the Senate Committee on Education and Labor, of which Senator Mead is a member, has under consideration S 1230, the Hospital Construction Bill introduced by Senator Brown of Michigan. The Society, through its proper committee, has carefully studied the bill and wishes to file with Senator Mead certain objections to it in its present form

"1 It objects to the inclusion of an osteopath on the National Advisory Hospital Council. This designation seems unnecessary, for no hospital would be created for that form of treatment alone since it is only a specialized form of treatment, and if specific forms of treatment are to be recognized other cults may naturally seek designation

"2 The bill seems to provide that only projects constructed within the first year shall be supervised by the advisory council. Other projects conceivably will be constructed in later years and the advisory council's authority should be extended to cover these also

"3 The definition of the term 'hospital' in Section 18 is so worded as to permit of the construction, equipment and operation of health, diagnostic and treatment centers without specifying that there must be available bed capacity and every hospital should be equipped to provide diagnostic laboratory service and to provide treatment for ambulatory cases, but the government would be defeating its one purpose of spreading medical service if it engaged in constructing health centers where free diagnostic and treatment services would be obtainable. Private physicians not employed in the centers would be unable to compete with the government centers

"Realizing Senator Mead's interest in matters of this character, it is suggested that the House authorize that this communication be sent to him with the request that he give it careful consideration, and if a hearing is held on the bill, that it be spread upon its minutes,"

your reference committee recommends that this resolution be changed so that paragraph 1 be deleted of its last phrase and to read as follows

"It objects to the inclusion of an osteopath on the National Hospital Advisory Council

lected annually since the effective date of the new law with no indication that it is not considered a permanent tax, and

"WHEREAS, there are no provisions or, at best, inadequate provisions for the care of indigent physicians in New York State, be it

"Resolved, first, that the Nassau County Medical Society requests an accounting of the monies collected for annual re-registration since the effective date of the law with a statement as to how such monies were expended, and be it further

"Resolved, second, that a sum of money be set aside from this fund to be made available to the indigent physicians of the state, and be it further

"Resolved, that a portion of the annual re-registration be henceforth allocated for such purposes, and be it further

"Resolved, that the delegates of the Nassau County Medical Society be instructed to present these resolutions to the annual meeting of the House of Delegates of the Medical Society of the State of New York to be held at Buffalo starting April 28, 1911, with the request that the Medical Society of the State of New York sponsor and seek the introduction and passage of such legislation as might be necessary to make effective the purposes of these resolutions"

We recommend that this resolution be referred to the Legislative Committee of the State Society for study, that any recommendation which may be forthcoming from the study in that committee be referred back to Dr. Van Kleeck and the Nassau County Medical Society

I move its adoption, sir

DR. E. HARRISON ORMSBY, *Montgomery* I second the motion

SPEAKER BAUER You have heard the report of the reference committee which recommends disapproval of this resolution, and that the matter be referred to the Legislative Committee of the State Society. It is the opinion of the Chair that the recommendation should read that it be referred to the Council, which would naturally refer it to the Legislative Committee. If you will make that amendment, that it be referred back to the Council for further consideration, I will put the question

DR. BULL Yes, the reference committee will accept that

There being no discussion, the motion was put to a vote, and was unanimously carried.

DR. BULL Now, this report is signed by myself as chairman, Emily D. Barringer, *New York*, Kenneth F. Bott, *Greene*, Elmer H. Ormsby, *Montgomery*, and Stanley C. Pettit, *Richmond*. I move that the report be adopted as a whole

DR. KENNETH F. BOTT, *Greene* I second that motion.

There being no discussion, the motion was put to a vote, and was carried

49 Report of Reference Committee on the Report of the Council—Part I—Postgraduate Education

DR. HARRY C. GUESS, *Eric* The reference committee on the Report of the Council consisted of the following: Oliver W. H. Mitchell, *Chairman, Syracuse*, George Baehr, *New York*, and Charles Dayton Post, *Syracuse*

The work of this committee has been most commendable

The cooperation of the State Health Department should be used to the fullest extent, and that the monies allocated by the State should be used at the discretion of the New York State Medical Society Committee. The courses chosen and the number of courses given have been excellent. The defense education is timely and should be augmented by the cooperation of this committee with committees from each county unit in establishing an industrial workers health committee. The part played by this committee in the maternal welfare work is commended, and the committee suggests a correlated report of all of the units in the State Society for publication in the JOURNAL. We believe that the funds expended will be returned manifold and that the postgraduate education will become a fixed asset in the Society.

We move the acceptance of this report, which is signed by myself as chairman, John J. Buettner, *Onondaga*, Irving Gray, *Kings*, and Bernard S. Straut, *Yates*

DR. JOHN J. BUETTNER, *Onondaga* I second that motion

There being no discussion, the motion was put to a vote, and was unanimously carried

50 Acknowledgment of Flowers to the Dental Society of the State of New York

SECRETARY IRVING At the registration desk you have seen some very nice flowers. These were sent to the Medical Society of the State of New York by the Dental Society of the State of New York, and I would move you, Mr. Speaker, that the Secretary be instructed to thank the Dental Society of the State of New York for that very pleasant gift.

DR. WALTER P. ANDERTON, *New York* I second that motion

SPEAKER BAUER I am sure that needs no discussion.

The question was called for, and the motion was put to a vote, and carried amid applause

51 Expression of Appreciation to Members and Officers of the Legislature, and to the Governor

DR. JOHN L. BAUER, *Kings* The Legislative Committee asks the House of Delegates to adopt an expression of appreciation to the members and officers of the Legislature, and especially to the Governor, for the courteous reception extended representatives of the medical profession and the thoughtful consideration they have given medical and public health measures that have come before them.

The motion was seconded by several.

SPEAKER BAUER I am sure it is not necessary to send that to the reference committee, and unless there is objection I will place it before you now.

The question was called for, and the motion was put to a vote, and was unanimously carried.

52 District Branches—Constitution and Bylaws (Section 68)

DR. THEODORE WEST May I be granted the floor for a question of information?

SPEAKER BAUER Yes

DR. WEST In the last meeting of the House

SPEAKER BAUER You have heard the report of the chairman of the reference committee pertaining to the Basic Science Law Is there any discussion?

DR. THOMAS M. D'ANGELO, Queens In recommending that the Basic Science Law be not approved, I would like to know on what grounds our committee disapproved the adoption of a Basic Science Law when the American Medical Association so heartily approves of the adoption of a Basic Science Law in the various states of the United States

SPEAKER BAUER Would you care to answer that question, Dr Bull?

DR. BULL I will ask Dr Hambrook to answer that question, if he is in the House

SPEAKER BAUER Dr Hambrook, would you care to answer that question?

DR. AUGUSTUS J. HAMBROOK, Rensselaer I think this might be much better explained by Dr Joseph Lawrence, who is very much interested in this matter In order to save the members of this House a repetition, if Dr Lawrence would come forward I believe he will be in a position to make a more satisfactory statement

SPEAKER BAUER If there is no objection, the Chair will grant the privilege of the floor to Dr Lawrence

EXECUTIVE OFFICER LAWRENCE Mr Chairman and Members of the House, in the first place New York State has a Basic Science Law It is far in advance of any of the basic science laws that are adopted and in practice in other states We require in this state one examination of all those who would practice medicine the osteopath, the homeopath, and the regular physician All take the same examination.

Those states that have basic science laws do two things They split the examination They require that the applicant for the privilege of practicing medicine shall take first an examination in usually six or eight subjects, anatomy, chemistry, and so on, with the stipulation that they shall take the examination in these subjects under a board of nonmedical men, that they shall be members of the faculty of a science school but must not or may not be medical men Having passed that examination, then they are granted a certificate to the effect that they have completed that examination, and that they are on their way to full certification. Later they take another examination, and this examination includes the variations, that is, if they are going to be an osteopath, then they build to that and pass an examination including osteopathy, if they are going to be a chiropractor, then they pass an examination including chiropractic, if they are going to be a medical physician, then they take their examination under the medical board Each takes the examination under his own separate board The physician will take his examination under the medical board, the chiropractor will take his under the chiropractic board, the osteopath will take his under the osteopathic board

Now what it would do in New York State is that it would reduce our medical standards because at the present time we require a higher standard, that is, the men must pass these subjects with a higher grade, they must pass them under medical men, and it is all one examination. There is no midway with the certificate Such a certificate can readily be misconstrued A per-

son who passes halfway can stop there and say he has a certificate, and it means that the law will have to be enforced more rigidly in order to catch him

The American Medical Association does not recommend a basic science law for New York State We have voluminous correspondence to that effect But they did recommend that it would be something toward abolishing the chaos that had existed or had developed in certain states like Michigan. Those states have had considerable difficulty, and they introduced the basic science law as a first step toward coming to what we have in New York State now, hoping that they will eventually reach it (Applause)

SPEAKER BAUER Does that answer your question, Dr D'Angelo?

DR. D'ANGELO Not entirely

DR. CHARLES GULLO, Livingston The remarks made by Dr Lawrence are just about 90 per cent wrong I don't think we should take much time on this now I agree with the committee's report for just one reason, because I am agreed that the resolution as introduced last year by me for Livingston County had some loopholes in it, susceptible to the objections which were pointed out to me at the last meeting However, Livingston County is prepared to introduce a new resolution at this meeting, and I hope to explain fully and establish definitely that the basic science law does not operate as Dr Lawrence pointed out

If Dr D'Angelo does not mind, I wish he would withdraw his objection at this time.

DR. D'ANGELO Very well!

SPEAKER BAUER The question was on the adoption of the committee report Will you read your final recommendation again, Dr Bull, so the House will have clearly in mind what is before them for adoption?

DR. BULL We had no recommendation We simply approved the report of the Council on the Basic Science Law as presented in the Annual Report, and I move the adoption of the report of the committee

The question was called for, and the motion was put to a vote, and was carried

48 Report of Reference Committee on Report of Council—Part XI—Medical Practice Act, Annual Re-registration Fee

(Section 20)

DR. HARRY S. BULL, Cayuga The resolution introduced by Dr Van Kleeck in behalf of the Nassau County Medical Society relative to the Medical Practice Act is disapproved by your committee

This resolution reads as follows

"WHEREAS, the Medical Practice Act of 1930 provides for the payment by every practicing physician of an annual re-registration fee of \$2, and

"WHEREAS, the medical profession was told at the time this law was proposed that the purpose of the fee is to provide the educational authorities of the state with funds with which to control the unlawful practice of medicine in the state with the implied or expressed promise that such fees were to be collected for a period of five years by which time the problem of the control of unlawful practice of medicine was expected to be solved, and

"WHEREAS, this annual fee has been col-

SPEAKER BAUER That resolution will be referred to the Reference Committee on New Business B, of which Dr DiNatale is chairman

Are there any further resolutions?

(There was no response)

SPEAKER BAUER The delegates' dinner this evening will take place in the Georgian Room, which is on the mezzanine floor. The time will be 6.30, and the price \$1.75, including tip. You will pay at the dinner, so every one who signified his intention of coming please be there at 6.30. We will have to have an evening session, so we will reconvene the House at eight o'clock.

Are there any reference committee chairmen ready to report?

(There was no response)

SPEAKER BAUER There are still a number of committee reports which we would like to have this afternoon, so I will declare a recess of ten minutes and ask you not to go very far so that we may reassemble in a short time.

(At this point there was a ten-minute recess.)

AFTER RECESS

SPEAKER BAUER The House will come to order.

The Chair recognizes Dr Schiff, Chairman of the Reference Committee on the Report of the Council, Part II, Public Health.

55 Report of the Reference Committee on Report of the Council—Part II—Public Health Matters

DR. LEO F SCHIFF, Clinton Your reference committee finds that the Council Subcommittee on Public Health and Education has ably covered its assignments on public health matters.

Maternal Welfare The plans of the special committee on maternal welfare acting as a subcommittee of the Committee on Public Health and Education are outlined and the division of the State and the regions with the names of the regional chairmen are stated. Your reference committee recommends the approval of these actions. I move the adoption of this section of the report.

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried.

Pneumonia Control. **DR. SCHIFF** The activities of the committee in this regard are recommended for approval. We would, at this time, also commend the New York State Department of Health for arranging for the distribution of sulfapyridine and sulfathiazole in addition to specific sera for the treatment of pneumonia.

I move the adoption of this section of the report.

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried.

4-H Clubs. **DR. SCHIFF** Your committee notes the productive activities of Dr J G Fred Hiss, chairman of a one-man subcommittee on this work.

Proposed Medical School in New York State. Your reference committee recommends approval of the action of the Council in opposing the granting of a charter for a new medical school to be known as the "Gorgas Institute."

I move the adoption of this section of the report.

The motion was seconded, and as there

was no discussion, it was put to a vote, and was unanimously carried.

Public Health Laboratories. **DR. SCHIFF** We note that the Committee on Public Health and Education has secured a revision of the memorial presented last year by the New York State Association of Public Health Laboratories. This revision proposes an interchange of information between the directors of approved laboratories and the county medical societies, looking toward increasing the scope of usefulness of the laboratories by familiarizing physicians with the services available. This is to be supplemented by occasional conferences between representatives of the Medical Society of the State of New York and the State Laboratory of the New York State Association of Public Health Laboratories, also by the publication in the *JOURNAL* of pertinent items relative to laboratory facilities from time to time. We recommend the adoption of the principles stated in the proposal and the appropriate action thereon by county medical societies and laboratory directors throughout the State.

I move the adoption of this section of the report.

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried.

Laboratory Medicine. **DR. SCHIFF** We note that conferences have been had with representatives of various organizations relative to the resolution asked by the House of Delegates last year which recommended that work of State and City Department of Health Laboratories be limited to the diagnosis of communicable diseases except in cases where these laboratory facilities were the only diagnostic facilities available to indigent patients. This is a matter which will bring out much discussion among the individuals concerned, and it will take considerable time to iron out many differences of opinion that arise. We recommend that the Council committee continue conferences looking toward the practical adoption of the spirit of this resolution by the laboratories concerned.

I move the recommendation contained in this section of the report.

The motion was seconded, and as there was no discussion, it was put to a vote, and unanimously carried.

Tuberculosis Conference Committee. **DR. SCHIFF** The objective of this committee, inaugurated under the auspices of the State Department of Health with representatives from all interested agencies, official and otherwise, who might be interested, is the eventual eradication of tuberculosis from the State of New York. It is too early to expect any definite results, and we recommend that the Council committee continue its work on this problem with due thought for both the public health and the practitioners of medicine.

I move the adoption of the recommendation contained in this section of the report.

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried.

Tattoo Code for the Serum Sensitive. **DR. SCHIFF** This matter was discussed by Dr H D Vickers, of Little Falls, whose attention was first called to the importance of the subject by experience at the time of a train wreck in Little

of Delegates, Dr Burk's Committee on District Branches made this following recommendation (I quote from the JOURNAL of June 15, 1940, on page 959)

"Your Committee is informed that the activities of the district branches at present consist almost entirely of holding an annual meeting and the report of this event is prepared and submitted to the Secretary of the State Medical Society by the presidents of the district branches. The custom of having each county society elect delegates to district branch meetings should be revived. With the above preface your Committee recommends that the Council appoint a committee to draft a brief constitution and set of bylaws for adoption by the district branches with the approval of these district branches.

"The Committee recommends your approval, and I so move

"The motion was seconded "

I should like to ask what was done about this recommendation, if anything

SPEAKER BAUER I think I can answer that question, Dr West. If not, I will ask Dr Lawrence to correct me. My understanding is that the matter was taken up with the District Branches, but on account of the crowded nature of their programs nothing was done at their annual meetings, but Dr Lawrence plans to take that up at the annual executive committee meetings which will be held this spring.

Dr West The reason I bring it up now is that this is my last appearance as district president, which you will probably all be very glad to know, but this district branch proposition is to me a very important and dear item. I think the district branches can be integrated so they will be a very valuable part of the Society, and I did not want to see this thing dropped.

SPEAKER BAUER It has not been dropped, that I know. Am I correct in what I said, Dr Lawrence?

SECRETARY IRVING You are, sir.

SPEAKER BAUER I am quite certain I am right, but I will check it with Dr Lawrence when he comes back, and make a further announcement on it, Dr West.

If there are no other reference committee chairmen ready to make a report, the Chair will now receive resolutions.

53 Basic Science Law

(Section 84)

DR. CHARLES GULLO, *Livingston*. This resolution is submitted by the Medical Society of Livingston County.

"WHEREAS, there are people in the State of New York practicing the healing art without having adequate knowledge of the human body, and

"WHEREAS, experience has shown that it is most difficult and often futile to effectively prosecute these people even when they have violated the Medical Practice Act, and

"WHEREAS, it is the duty of Organized Medicine to promulgate medical information and prevent fraudulent and inferior medical service to our people, now therefore be it

"Resolved, that the House of Delegates of the New York State Medical Society hereby authorizes and directs the President of the

New York State Medical Society to present to the Legislature of the State of New York a suitable bill to correct this condition and that such bill shall provide substantially as follows

"Section 1 Definitions, as used in this Article

"The practice of the Healing Art is defined as follows. A person practices the healing art within the meaning of this article who holds himself out as being able to diagnose, treat, operate, or prescribe for any disease, pain, injury, deficiency, deformity, or physical condition of the human body, and who shall either offer or undertake by any means or method to diagnose, treat, operate or prescribe for any disease, pain, injury, deficiency, deformity or physical condition of the same.

"Section 2 Qualifications

"No person shall practice the healing art unless he shall first have complied with the following prerequisites

"First, he must pass an examination given by the Board of Regents in the basic sciences, namely, anatomy, physiology, chemistry, bacteriology and pathology, and upon passing such an examination shall receive a Certificate of Proficiency in the Basic Sciences which shall not confer the right to practice the healing art, and

"Second, after receiving said Certificate of Proficiency, he must pursue other studies as established by law and appear before the Board of Choice of the Board of Regents for further examination, and after having satisfactorily passed such examination, and having fulfilled other requirements prescribed by law, he may be licensed to practice

"Section 3 Penalty

"Any person violating any provision or provisions of the foregoing Sections shall be guilty of a misdemeanor punishable by law."

SPEAKER BAUER This resolution will be referred to the Reference Committee on New Business A, of which Dr Simpson is the Chairman.

54 Medical Relief—Ambulatory Care

(Section 78)

DR J LEWIS AMSTER, *Bronx*. Our delegates have been instructed by the Bronx County Medical Society to introduce the following resolution

"WHEREAS, the indigent of the City of New York as provided with medical care through a plan devised by the Medical and Nursing Service for Home Care, and

"WHEREAS, these same indigents require ambulatory care for which no provision is made, and

"WHEREAS, the physicians of the City of New York are supplying this ambulatory care without remuneration,

"Resolved, that the Bronx County Medical Society recommend that provisions be made for the ambulatory care of indigent patients in the office of the private practitioners and that the physicians be adequately remunerated for this care, and be it further

"Resolved, that these resolutions be introduced at the House of Delegates at the meeting of the New York State Medical Society in April, 1941."

Treasurer (Section 10) DR KLEIN To acquire an intelligent understanding of the report of the Treasurer, a thorough study must be made of the accountant's figures, the report of the Publication Committee, and, above all, the supplementary report of your Treasurer

The accountant's figures show a surplus of income over outlay of nearly \$19,000 These figures are meaningless unless we know the details and comparative figures The past year's activities and various changes have been extraordinary and necessitated expenditures that should not recur in the near future The moving of the office, the rearrangement of the inner workings and business procedures, new methods of accounting and the Publication Committee workings have necessitated an outlay that may be considered as establishing almost what amounts to a new business These matters have incurred expenditures that must not be regarded as such, but should be considered as outlays that spread over a number of years

Viewing the report in this respect, we are glad to see that much progress has been made toward better business methods resulting in far better methods of conducting the affairs of the Society

With these rearrangements, any one interested can see a bimonthly exact account of the financial standing of the Society

The future, while unpredictable, must be viewed with anxiety As pointed out by your Treasurer, many men will be called to service and dues will shrink to a point not estimable at present Your Treasurer appears much worried as to the way it will affect our financial condition Your committee feels that while our treasury may not be able to show a surplus in the next year, the probabilities are that the net result will not affect us much We, as well as the rest of the country, may have to forego certain desired improvements We make this point simply because in our opinion to curtail the activities when we finally have them working well would be poor economy We particularly feel that with the present setup in the Publication Committee, and with Mr Anderson's splendid work, not one iota of curtailment should be instituted at this time

Your Treasurer, in his supplementary report, proposes certain recommendations

1 At his request the House of Delegates proposed an amendment to the Constitution to empower the appointment of a second assistant treasurer His suggestion that this be not acted upon this year is approved by your committee

I move the approval of this recommendation.

I understand, however, that this constitutional amendment has already been withdrawn.

SPEAKER BAUER Yes, that has been withdrawn.

DR. KLEIN So it will not be necessary to vote on that again.

SPEAKER BAUER No, it has been withdrawn.

DR. KLEIN On his second recommendation, in view of the excellent work that resulted from last year's Committees on Office Administration and Policies, and Publication, they should be continued. It is advisable that these committees be composed of local members whose services can be had at short notice His recommendation that a separate member of the Board of Trustees be a member of each of these two committees is advisable

Your committee moves the approval of this recommendation

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried

DR. KLEIN As to his third recommendation, your Treasurer proposes the creation of a *Library Fund* Your committee thinks that the proposal is not well defined, and begs to submit the same resolution in the following form

"The creation of a fund for a library in order to facilitate the work of the Publications Committee Appropriate funds should be budgeted"

I move the adoption of this part of the report

The motion was seconded.

SPEAKER BAUER You have heard the recommendation of the chairman of the reference committee, which substitutes a recommendation on the question of a library Is there any discussion?

DR. GEORGE W KOSMAK, *New York* May I expand on that for a minute? I feel, perhaps, the reference committee did not quite understand my recommendation I believe that this recommendation should be given more study, and my recommendation was that we refer it to the Council for further study If that would be agreeable to the reference committee I think that should be substituted.

DR. KLEIN That is agreeable

DR. KOSMAK I think this should be given more thought and study before any final decision is arrived at as to how to accomplish these ends

SPEAKER BAUER I understand then, Dr. Klein, you withdraw that recommendation and substitute that the matter be referred to the Council for study

DR. KLEIN The recommendation should read

"The creation of a fund for a library in order to facilitate the work of the Publications Committee should be referred to the Council for study and action."

Is that agreeable?

DR. KOSMAK Yes

SPEAKER BAUER The recommendation of the reference committee is amended so that the matter is referred to the Council for study Is there any further discussion on it?

DR. THOMAS A. MCGOLDRICK, *Kings* Was there a descriptive phrase as to the kind of library that was suggested?

DR. KLEIN Yes

DR. MCGOLDRICK May I have it read?

DR. KLEIN There was no descriptive phrase in the recommendation, but it meant a reference library to facilitate the work of the Publication Committee, such as interchangeable literature, magazines, etc

DR. MCGOLDRICK I should like it to read "reference library"

DR. KOSMAK It so read in the original recommendation made in my report as Treasurer

DR. KLEIN That is agreeable

SPEAKER BAUER "Reference library" is inserted in the recommendation.

DR. KLEIN Yes

The question was called for, and the motion was put to a vote, and was unanimously carried.

DR. KLEIN As to the fourth recommendation of the Treasurer, your reference committee feels

Falls in April, 1940 Several of the patients were brought in unconscious In making tests to determine serum sensitivity before administering tetanus antitoxin, two of these patients were found sensitive It was thought that it might be useful to establish a practice of putting a tattoo on the bodies of such people so that serum-sensitive cases would be recognized easily, perhaps save life in some instances where the urgency might seem so great that serum would be administered without a preliminary test This idea could be elaborated on to include other important conditions, particularly diabetes

The Council committee did not approve such a code on the ground that it would not be readily accepted, could not be made compulsory, and might be subject to improper use The Council did advocate identification by cards or tags

Your reference committee feels that this is a matter of more than state-wide importance and should be referred to the American Medical Association for study Even though it cannot be made compulsory, the establishment of a definite authoritative universal code for identification of these types of patients when unconscious would be highly useful Naturally, it will depend upon each individual concerned as to how far he may choose to go in having such identification. Some will be quite willing to have permanent tattoo, while others may wish to carry a tag, and some others neglect or refuse to do anything about it These attitudes do not constitute a valid objection to the plan as a whole We, therefore, recommend that the Council of this Society be instructed to draw up a resolution to be presented to the American Medical Association at its meeting in June of this year, requesting the American Medical Association to appoint a committee to study this question and take suitable action thereon

I move the adoption of this recommendation contained in this section of the report

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried

Demolition of Manhattan State Hospital. DR. SCHIFF Your reference committee approves the action of the Council in opposing demolition of the Manhattan State Hospital and reference of the matter for further study to the Committees on Public Health and Education and Public Relations and Economics for study and report

I move the adoption of this section of the report

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried.

DR. SCHIFF Dr. Mitchell, Chairman of the Council Committee on Public Health and Education, presented two matters which had not come up in time for inclusion in the official report

Industrial Health Program One of the two matters in regard to industrial health. Since this had to do mostly with graduate education on the subject of industrial health, it was suggested that Dr. Mitchell report on the subject to the Reference Committee on Part I of Report of Council (Postgraduate Education) The topic is in the early stages of discussion and requires further study, best by a special committee to be set up by the Council as a subcommittee of the Committee on Public Health and Education

SPEAKER BAUER Do you wish to move that as a recommendation?

DR. SCHIFF No, I don't Unless the other committee fails to make a recommendation on it, we feel we should not go that far

Rheumatic Fever Program. In conjunction with the State Department of Health and with a setup including representatives of all interested organizations, similar to that of the Pneumonia Control Program, it is proposed to institute a Rheumatic Fever Program This program would include education, both lay and graduate medical, hospitalization including arrangements for a long convalescent period, study and possibly demonstration setups It is too early to make any more definite statements as to the program It is probable that most of the funds needed at the beginning of the program, at least, can be secured through the State Department of Health and interested private organizations We recommend that the Council Committee on Public Health and Education continue its work on the rheumatic fever program I move the adoption of this recommendation

The motion was seconded, and as there was no discussion, the motion was put to a vote and was unanimously carried.

DR. SCHIFF In conclusion, we desire to voice the thought that the Committee on Public Health and Education has been able to accomplish a great deal with the funds at its disposal, and to second the hope expressed by our retiring President in his address this morning that more funds may be made available to this important committee in the ensuing year

Mr Speaker, I move the adoption of the report as a whole

The motion was seconded, and as there was no discussion, the motion was put to a vote, and was unanimously carried

SPEAKER BAUER The report is adopted Thank you, Dr Schiff

56 Report of Reference Committee on the Reports of the Board of Trustees, Treasurer, and Council—Part XII

Board of Trustees—DR. WILLIAM KLEIN, Bronx Your reference committee, having studied the report of the Board of Trustees, begs to make the following comment

The Trustees have carried out the recommendations and contemplated changes in the disbursement of the Society's funds These reflect definite improvement in the management They have kept within the budgetary allocations The moving of the office and other more modern arrangements of the business part of our organization necessitated expenditures of additional funds that were not in the budget

In view of the marked improvement resulting from these changes, your committee believes that it was sound practice

The concentration of liquid currency is most commendable, as in these times not much can be expected from investments in the open market while government securities yield very little

Your committee moves the approval of the report of the Board of Trustees as printed in the JOURNAL.

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried

DR. HARRY ARANOW, *Bronx* I hope that the Council has as much feeling as the County Society, and I am sure that unless there is a definite reason to the contrary such request for the remission of dues will not be denied

DR. THOMAS A MCGOLDRICK, *Kings* Every man taken into service does not relinquish immediately his private practice nor the income from his profession. There are many men in Greater New York who are assigned to duty at offices in New York or on Staten Island and who give a few hours a day on the week days to that work, for which they receive a good salary, and who continue their practice in the remaining hours of the day

There are many such cases, and it seems to me that the State Society should not give over its authority and power altogether even to the County Society. The County Society will make its recommendation and will give its reasons, and then the Council should have the authority to agree or disagree in the relinquishment of dues to the State Society. I think the term "may" is for the benefit of the Society and for the men themselves

SPEAKER BAUER Is there any other discussion on the amendment?

DR. WALTER P ANDERTON, *New York* As a member of Dr Klein's committee, I feel that this resolution was recommended by the Council, and was carefully studied by the committee, and so deserves the support of this House

The question on the motion as amended was called for, and the amended motion was put to a vote, and was lost

SPEAKER BAUER The amendment is lost. You have now before you the original motion which is that at the request of any component county medical society the annual assessment on any of its members temporarily on active duty in the military or naval service of the United States may be remitted by the Council in full or in part during the period of such service

The question on the original motion was called for, and the motion was put to a vote, and was carried

SPEAKER BAUER The resolution is adopted

DR. KLEIN I move the adoption of the report of the reference committee as a whole

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried.

SPEAKER BAUER The report as a whole is adopted. Thank you, Dr Klein!

DR. SAMUEL J KOPETZKY, *New York* Is it in order to present a resolution at this time?

SPEAKER BAUER Yes

57 Health Programs in National Defense (Section 80)

DR. SAMUEL J KOPETZKY, *New York* This morning, gentlemen, I outlined a yardstick for policy. I now am presenting a resolution that would integrate this into actual practice

"WHEREAS, from many quarters measures which involve medical care of the public are being proposed in the interest and under the banner of the National Defense Program, and

"WHEREAS, the Medical Society of the State of New York heartily favors the National Defense Program and has placed all its facilities at the disposition of the governments, state and

Federal, in the furtherance of this Defense Program, and

"WHEREAS, it is a matter of fixed policy of the Medical Society of the State of New York to safeguard the modes of medical practice which have given the communities of this State its present high level of health as an outstanding medical achievement, involving as it does preventive, curative and public health medical measures, therefore be it

"Resolved that each and every proposition which is advanced from any quarter whatsoever which would integrate a medical service to the community shall be studied as to its adoption into the emergency program with every necessary protection as to its discontinuance when the present emergency shall have passed, and which shall be written into its procedures, and be it further

"Resolved, that it is the expressed policy of the Medical Society of the State of New York that at their introduction the temporary nature of necessary health measures be stressed as they are developed and that no general program shall be approved coming under the terms 'of part of the Defense Program' which permanently would change the nature and mode of the present method of medical practice"

SPEAKER BAUER That resolution will be referred to the Committee on New Business "C," the reference committee of which Dr Masterson is chairman

58 Report of the Reference Committee on the Report of the Council—Part IX—Workmen's Compensation

DR. COBURN A L CAMPBELL, *Suffolk* We heartily endorse the active interest of the Committee on Workmen's Compensation in all phases of the Workmen's Compensation Law affecting medical practice in this state. We have carefully studied their report, which again stimulates us to realize the tremendous volume of work which is covered by the Workmen's Compensation Bureau

We note the committee's report on arbitration and again call attention to the small percentage of cases going to arbitration and the fairness of arbitration. We call attention to their reminder that, owing to the increase in employment in 1941, we will have a larger number of compensation accidents. Your committee approves that an effort should be made to modify Section 13-g (2) to remove the necessity of the Medical Society arbitrating hospital bills

I so move.

DR. CHARLES L POPE, *Broome* I second the motion.

SPEAKER BAUER You have before you the recommendation of the reference committee recommending that an effort be made to modify Section 13-g (2) of the Workmen's Compensation Law. Is there any discussion?

The question was called for, and the motion was put to a vote, and was unanimously carried

DR. CAMPBELL Your reference committee agrees with the report that there should be a revision of the Statute Subsection 13-g to include a sentence to enforce payment of "bills not objected to," without the necessity of court action, and also an amendment to Section 13-g (2) whereby disputes with regard to the payment of a bill,

that the appointment of a committee to study the question of a *Benevolence Fund* is desirable

Your reference committee moves the approval of the appointment of such a committee

It seems that other states have adopted sort of a Benevolence Fund for various purposes, which we need not go into now While we do not feel that large expenditures can be made at this time in that direction, your reference committee feels that such a committee should be appointed for the purpose of studying the question of benevolence as practiced by other state societies

The motion was seconded

SPEAKER BAUER Approval is requested for the appointment of a committee to study the matter of a benevolence fund for the State Society Is there any discussion on that recommendation?

DR. WALTER D LUDLUM, Kings In accordance with analogy, as we decided some years ago, and as we have up to now continued that practice, that the appointment of such committees would lie with the Council, if the reference committee would accept the suggestion I would suggest that the Council be asked to consider this matter with such committee as it sees fit to appoint

SPEAKER BAUER Your point is well taken All committees except those that function during the sessions of the House must be appointed by the President with the consent of the Council

DR. LUDLUM And the report of the reference committee especially called for a special committee

DR. KOSMAK May I say again that that was the wording in my report Evidently it escaped the notice of the reference committee that I asked that it be referred to the Council for study

SPEAKER BAUER You recommended that it be referred to the Council for study?

DR. KOSMAK Yes

SPEAKER BAUER Does the reference committee accept that amendment?

DR. KLEIN Yes We will change it to make it that the matter of a Benevolence Fund now be referred to the Council for study

There being no further discussion, the motion was put to a vote, and was unanimously carried

Remission of Dues of Members in Active Military and Naval Service (Section 18) **DR. KLEIN** As to the resolution introduced by the Erie County Medical Society reading

"WHEREAS, the induction of physicians into military service removes them from their practice, and

"WHEREAS, this results in a great sacrifice to the said physician both personally and financially, therefore be it

"Resolved, that the Medical Society of the County of Erie go on record as favoring the waiving of both county and state dues of said physician while in active military service, this resolution having been discussed and adopted at the stated meeting of the Medical Society of the County of Erie held February 17, 1941, be it further

"Resolved, that the Medical Society of the County of Erie beg the Medical Society of the State of New York to take such action"

this resolution is covered by the report of the Council, Part XII, which reads as follows

"Be it resolved by the House of Delegates of

the Medical Society of the State of New York assembled in annual meeting at Buffalo, New York, on April 28, 1941, that the annual per capita assessment on members of the component county medical societies shall remain as at present, namely, ten dollars per annum"

I move the adoption of that part of the resolution

The motion was seconded, and as there was no discussion, the motion was put to a vote and was unanimously carried

DR. KLEIN Continuing the resolution

"Be it further resolved that, on the request of any component county medical society, the annual assessment of any of its members temporarily on active duty in the military or naval service of the United States may be remitted by the Council in full or in part during the period of such service"

I move the approval of this part of the report of the Council, covering the second part of this resolution

The motion was seconded

SPEAKER BAUER It has been moved and seconded that this part of the resolution pertaining to the remission of dues of members in military service be adopted. Is there any discussion on it?

DR. ALFRED M. HELLMAN, New York I should like to move to amend so that the word "may" be changed to "shall" I think that allows powers to somebody to do it or not to do it, and I don't think that was meant

The amendment was seconded

SPEAKER BAUER It has been regularly moved and seconded that the motion be amended to substitute the word "shall" for "may," so that it will read, "shall be remitted by the Council in full or in part," etc

DR. WALTER D LUDLUM, Kings I would assume, not having had anything to do with this before, that the word "may" was put in deliberately, in order that the Council may investigate each individual case and determine whether that case deserves remission or not Therefore, the amendment should not prevail

SPEAKER BAUER Is there any further discussion on the amendment?

DR. HELLMAN I have not any doubt it was put there purposely That is the reason I object to it If a man is in service, I don't think he should have any investigation made into his affairs If he is in the service that should finish the investigation, and he should have the right to have his dues remitted

DR. LUDLUM May I respond to that because that is the exact point I wish to make. How is it going to be determined that he is in service if he is not investigated? I don't mean any improper investigation should be made, but he should not have his dues remitted merely because he says he is in service That is not all there is to it You have to know the time of induction and all those details, so an investigation should be made, but it should be made as simple as possible If you put the word "shall" in, you will have to put in many qualifying clauses, such as, after proper investigation by a proper committee, who has determined that he has been inducted properly, and so on and so forth

DR. JOSEPH WRANA, Queens Your County Medical Society makes the request and can perform that function.

I think you should know something about this report. Dr Driscoll, of Richmond, was originally designated as chairman of this committee. At the last moment he had to withdraw as chairman, and Dr Campbell had to fill in at very short notice. I think he deserves a great deal of credit for the excellent way in which he presented this report.

59 Announcement of Death of Dr Arthur S Driscoll, of Richmond

SPEAKER BAUER Now, gentlemen, I have a very sad announcement to make. I just spoke about Dr Driscoll. As you may know, Dr Driscoll was taken seriously ill. He had been ill for some time, but he had a stroke on Friday, and I am sorry to announce to the House that he died last night. I feel that the House should take some notice of his death at this time. He was long a member of this House of Delegates and in 1937 and 1938 was second vice-president of the Society. I am going to ask the House to rise for a moment in Dr Driscoll's memory.

The House arose and stood for a minute with bowed heads in Dr Driscoll's memory.

60 Report of Reference Committee on New Business C—Medical Preparedness—Foreign Service of American Physicians

(Section 25)

DR JOHN L MASTERSON, Kings On the resolution presented by Dr L D Redway, of Westchester, reading:

"WHEREAS, the President of the United States, on April 17, 1941, has, as President of the American Red Cross, endorsed the appeal of the British Red Cross for one thousand young American physicians, and

"WHEREAS, the American Medical Association, in an editorial in the *Journal of the A.M.A.* has 'assured Britain of every possible assistance,' and has supplied the Red Cross with lists of eligible young doctors, thereby endorsing the principle that American physicians be encouraged to volunteer for foreign service, and

"WHEREAS, of the 5,000 annual graduates of American medical schools only 3,000 or 60 per cent are physically acceptable for military service and available to meet the demands of an expanding military establishment, thereby necessitating substantial requisitions from the ranks of those now in private practice in addition to depriving the civil population of 50 per cent of the new graduates, and

"WHEREAS, the maintenance of those standards of military and civil health made possible by the thorough education and training of the American Physician and now demanded by the people of the United States, is vital to the defense of the nation and the welfare of its population, therefore be it

"Resolved, that the Medical Society of the State of New York instruct its delegates to the A.M.A. to propose by resolution or otherwise, that the American Medical Association immediately state its policy with respect to further depletions of the reservoir of available young American physicians in the event of further requisitions of volunteer medical personnel emanating from a foreign source,"

your reference committee approves of this resolution and recommends its adoption.

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried.

61 Report of Reference Committee on New Business C—Advertising in Newspapers by Physicians

(Section 30)

DR JOHN J MASTERSON, Kings On the resolution presented by Dr Samuel M Kaufman, of New York County, reading:

"WHEREAS, Governor Lehman recently signed the Milmo Bill which limits drastically commercial displays and flagrant advertising by licensed podiatrists in the State of New York, and

"WHEREAS, the dental profession previously succeeded in bringing about legislative enactment which reduced advertising abuses in the dental profession, therefore be it

"Resolved, that the House of Delegates of the Medical Society of the State of New York go on record as disapproving all advertising in newspapers by practicing licensed physicians of the State of New York, individually or in groups, in the form of announcing their office address, office hours, kind of practice or particular cure to the public, and further be it

"Resolved, that the House of Delegates instruct the Committee on Legislation of the New York State Medical Society to take any necessary action to amend the present law to this effect,"

your reference committee approves of this resolution and recommends its adoption. I so move.

DR G SCOTT TOWNE, Saratoga I second the motion.

SPEAKER BAUER You have before you the report of the reference committee, which carries with it the adoption of the resolution. Is there any discussion?

DR HARRY ARANOW, Bronx I had an idea that such a provision was passed a long time ago. I thought such advertising was contrary to medical ethics.

SECRETARY IRVING I think you are right.

DR SAMUEL M KAUFMAN, New York This resolution was introduced by me two years ago. It is true that such advertising was declared unethical, but it is not unlawful. Therefore, a man who does not belong to the State Society can advertise, whereas with this enacted we could get hold of them whether they are members of the Medical Society or not.

DR MASTERSON This would affect all physicians if such a law were passed, whether they are members of the county societies or not.

DR ARANOW I doubt if you will get such a law through the Legislature. The Legislative Committee of the State Society has been endeavoring to get such a bill passed year after year, and has thus far been unsuccessful.

The question was called for, and the motion was put to a vote, and was unanimously adopted.

62 Report of Reference Committee on New Business C—Deferment of Medical Students

(Section 31)

DR JOHN J MASTERSON, Kings On the resolution introduced by Dr M E Marsland, of Westchester, reading:

because of alleged failure of a physician to obtain authorization, should be arbitrated

I move the adoption of this part of the committee's report

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried

DR CAMPBELL Attention is called to the County Societies to continue to stress the importance of filing necessary reports under the law effective July 1, 1940, also to note that care must be exercised by attending physicians in calling consultants and ordering x-rays, in old protracted cases, also the necessity to request authorization for special treatments

I move the adoption of this part of the committee's report

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried.

DR. CAMPBELL We agree with the strong recommendation by the Director of the Workmen's Compensation Bureau of the State Society that there be no change in Rule No 7, which gives the employer or carrier five working days in which to respond to the request for authorization under Section 13-a (5)

I so move

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried

DR. CAMPBELL Your committee calls attention to the recommendation that County Societies simplify the symbols given to practitioners under the Workmen's Compensation Law Also, that before a compensation board refuses to qualify a physician, he be given a *personal* hearing before the board or committee, and that, in case of rejection of either an original application or request for a revision of rating, minutes of the board or committee be recorded and a copy be sent to the Director of Bureau of Workmen's Compensation, Department of Labor Also, the committee strongly advises the setting up of a qualifying committee wherever possible to serve in an advisory capacity to the Workmen's Compensation Committee or Board

I move the adoption of this portion of the committee's report

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried

DR CAMPBELL We endorse the recommendation that the County Society Compensation Committee or Board keep in contact with the licensed medical bureaus and ascertain that they are maintaining proper equipment and complying with the provisions of law, *especially in regard to reporting cases and free choice of physician*, also that revision of the rules governing medical bureaus be made, in order to improve the quality of medical care rendered to workmen.

We also agree that rules and regulations be set up by the Department of Labor to cover first-aid bureaus

I move the adoption of this portion of the report

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried

DR. CAMPBELL We note that the Medical Society Bureau has been, and is always, ready to give aid in the settling of bills and in other mat-

ters, and it is strongly recommended that the Bureau be consulted in the first instance in all compensation matters rather than the Labor Department

We observe that reports from the Labor Department, after hearings and examinations, will become available to local county societies. We believe that this is a step in the right direction and will facilitate the handling of protracted cases

Your reference committee approves of the Director's efforts and the results he obtained in his various appearances before the Industrial Board in regard to "*Fees for Testimony*" and the payment of x-rays ordered by the referee, also in the payment of bills where no time was lost We note that the Director's plan in reference to the Industrial Dermatoses is still under advisement by the insurance carriers, and will if accepted be submitted to the Industrial Commissioner, Board, and Council for approval. This is an important matter and will be of great value to physicians

I move the adoption of this part of the report.

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried.

DR. CAMPBELL The report calls attention to the new schedule of fees for x-rays of multiple injuries or parts, also to proposed amendments to the Workmen's Compensation Law

We endorse the recommendation that any and all attempts to permit partially trained and unlicensed practitioners to practice under the Workmen's Compensation Law be combated.

I so move

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried

DR CAMPBELL Attention is called to the arrangement of the supplying of reporting forms by the Labor Department to the County Medical Societies Physicians are requested to apply to the County Medical Societies and not to the Labor Department

The tremendous volume of the activities of the Bureau is shown in the report by a brief summary of a typical month's activities

The House of Delegates last year recommended to the Council the consideration of employment of a Director of Workmen's Compensation on a full-time basis The matter was referred to the Council

While the importance of the work of the Bureau and its effect on medical practice justifies the continuance of the Bureau, the question of full or part-time employment at this time is referred to the Council for further study

We commend the excellent efficiency of the Director of the Bureau and hereby tender our appreciation of his work for the Society

I move the adoption of this portion of the report

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried.

DR. CAMPBELL I now move the adoption of the report of the committee as a whole

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried.

SPEAKER BAUER The report is adopted as a whole Thank you, Dr Campbell

Dear Doctor—
 Why don't you
 follow the advice you
 so often give others?
 It would do you a
 world of good, and

"WHEREAS, the experience of belligerent nations in the World War and in the present conflict amply demonstrates the necessity for insuring a continuing supply of well-trained medical graduates, and

"WHEREAS, the United States Army in 1917-18 permitted medical students on active service to be transferred to the Reserve for the purpose of completing their medical course, on application to and approval by the Surgeon General, therefore be it

"Resolved, that the Medical Society of the State of New York instruct its delegates to the American Medical Association to introduce a resolution, memorializing the Surgeon-General to give consideration to similar action with respect to medical students inducted into active service in the present emergency."

your reference committee approves of this resolution and recommends its adoption I so move

DR G SCOTT TOWNE, *Saratoga* I second that motion

SPEAKER BAUER You have before you the adoption of the Report of the Reference Committee which carries with it the approval of the resolution Is there any discussion?

DR THOMAS A. MCGOLDRICK, *Kings* For information, has the Surgeon-General the authority under the Selective Service Act to give any such order at the present time? Does that not come under Mr Dykstra, who is in charge of the administration of that act? I feel very confident that is so, and to make sure in any case I would like to amend that so his name and office be also inserted in that resolution, as well as the Surgeon General's

SPEAKER BAUER I might say for information that the Surgeon General would have no authority at all It would be the General Staff and the Adjutant General The Surgeon General could only recommend

DR. MCGOLDRICK To the Administrator of the Selective Service Law?

SPEAKER BAUER Yes

DR MCGOLDRICK I would like to amend that so that the resolution be also addressed to the Chief Administrator of the Selective Service Law

The amendment was seconded by several

SPEAKER BAUER The amendment has been proposed to include the Administrator of the Selective Service Act in the resolution Is there any objection to that amendment?

DR CHAS GORDON HEYD, *New York* I think Dr McGoldrick is out of order The resolution states after he is inducted into active service which is the Army

SPEAKER BAUER Will you read that section again, Dr Masterson, in order to clarify it?

DR MASTERSON I will read the last paragraph I think that is all that is necessary

"Be it resolved that the Medical Society of the State of New York instruct its delegates to the American Medical Association to introduce a resolution, memorializing the Surgeon-General to give consideration to similar action with respect to medical students inducted into active service in the present emergency"

This only applies to medical students who have been inducted I understand from Dr Marsland, who appeared before our committee that he was

a medical student at the time of the last World War in the National Guard He and five other young men who were medical students were inducted into service, and they were there a short time when they were notified by the Attorney General to go back to school and continue their studies The object of this resolution, as I understand it, is that if any such similar instances have taken place at the present time, such men be given the same consideration they were given during the World War

SPEAKER BAUER I think that Dr Heyd's point is well taken, and the amendment is out of order, so it will stand as originally read Is there any discussion further?

The question was called for, and the motion was put to a vote, and was unanimously carried

63 Report of Reference Committee on New Business C—Deferment of Medical Students

(Section 16)

DR. JOHN J. MASTERSON, *Kings* The resolution, as introduced by Dr John Donovan, of the Medical Society of Erie, pertaining to the deferment of medical students, reads

"WHEREAS, medical men are necessary for the proper functioning of the Army and for the care of civilian population, and especially so during an emergency, and

"WHEREAS, the drafting of medical students would interfere with the normal training and graduation, as many of them would not return for the completion of the study of medicine when the course has been interrupted for one or more years, therefore be it

"Resolved, that the Medical Society of the County of Erie go on record against the drafting of medical students and also instruct its delegates to implore the Medical Society of the State of New York to do everything in its power to allow the deferment by Selective Service Boards of medical students, thereby permitting them to complete their medical education, and be it further

"Resolved, that the Medical Society of the State of New York send letters to various Draft and Appeals Boards appraising them of the gravity of the situation"

Your reference committee approves the resolution in principle, but not the verbiage, and does not desire to recommend a blanket deferment for medical students or enrolled medical students as it is contrary to the spirit of the Selective Training and Service Act

The Selective Service Law and the policy expressed by the National Selective Service declares that a student pursuing a course of study by which he is preparing himself for an occupation which is "essential to the health, safety or interest of the nation" may be deferred under the regulation

The committee holds that a student during the course of his medical education is in the category Furthermore a student who has successfully completed his premedical course and has been enrolled as a student in a College of Medicine of approved standing is likewise a necessary man who should be deferred.

The committee therefore moves the adoption of the resolution in principle and also moves the

adoption of our herein expressed opinion, as interpreting the resolution

Furthermore we recommend that a copy of this resolution be sent to the American Medical Association for its information and action, the first "Resolved" clause to include "and of students who have been enrolled," after the words "medical students"

AN ODE

(Owed to our Doctors—the Examining Physicians)

(This poem was written by Denis H. O'Brien, Clerk of Local Board No. 2, Yellowstone County, with apologies to "Kipling" and dedicated to the striving doctors, clerks and stenographers in that county)

You make talk of words and phrases
And of questions that it raises
When our doctors send their Forms "Two
Hundred" in,
And it certainly is slaughter
When they don't write like they oughter,
It's their scribbled hieroglyphics, that's a sin
Now the words I try to type
Make me wish for something ripe
For to throw, to show my vengeance mud my
tears

Now of all that learned crew
There was none wrote words I knew,
It's unveiling of his secrets—Doctor fears
So it's scan—scan—scan,
With the wrinkles growing deeper on my
pan

What's the use, what should I die for
If those words, you can't decipher,
You're no better man than I am, Doctor-man

Now your "P" and "D" and "B"
They are all alike to me
And your "S"es look like "M" or "X" or "L,"
And I wouldn't feel the sadder

I so move

The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried

SPEAKER BAUER It is nearly 5 50, and as we are to have dinner in the Georgian Room at 6 30 we will now take a recess until 8 o'clock, tonight
Please be here promptly

The session recessed at 5 50 P M

And I wouldn't be much madder
If in Wong Sun's native language you would spell
All the aches and pains and troubles,
To my brain, are empty bubbles,
Cause they could mean mostly anything at all
How I wish that I'd seen college
And had gained tremendous knowledge
Like you, dear Doctor, from some noted Hall

But it's scan—scan—scan,
With the wrinkles growing deeper on my
pan
What's the use, what should I die for
If those words, you can't decipher,
You're no better man than I am, Doctor-man
As I finished with this verse,
I could think of nothing worse
Than to take it to the doctor and insult him,
So I walked right to his door
And I bravely crossed his floor
As if I called upon him to consult him
Then I handed him this script
And I said, "You must have skipped
Every class you had in penmanship and writing"
In reply he simply said
"It's your ignorance, instead,
You've never learned to read, so stop your
fighting"

So it's scan—scan—scan,
Perspiring, working, slaving all I can
Now I've razed you and I've flayed you
By the living gawds that made you
You're a better man than I am, Doctor-man

AMERICANS OF 1840 COULD DRINK A QUART OF WHISKEY A DAY

The American of 1840 could drink nearly a quart of whiskey (29 ounces) every day and still keep his health and live to a good old age, but the average American of today cannot, Dr. Norman Jolliffe, of New York University, told the American Association for the Advancement of Science as reported in the *Science News Letter*

The immunity of our great grandfathers to the diseases of alcohol was due to their superior intake of vitamin B, Dr. Jolliffe explained. The vitamin deficiency that scientific study has recently demonstrated to be the real basis of the so-called alcoholic diseases is due not so much to an absolute lack of vitamin B, as it is to a vitamin intake which is too low in proportion to the calories. Increasing the calories consumed by experimental animals that are getting too little vitamin B, only increases their liability to deficiency disease. Those that eat too few calories are safest

The average American of drinking age today consumes more than 200 calories every day just

from his alcohol in addition to the nonalcoholic calories in his drink and the calories in his food. This extra 200 calories cuts the important ratio between vitamin B₁ and calories from the alcohol-free 3 32 to 3 13. This means an 18 2 per cent reduction in the already slim margin of safety for this vitamin.

The average American of 1840 had a ratio of 7 2 and a margin of safety of 230 per cent

It is a mistake, Dr. Jolliffe emphasized, to assume from the recent demonstration of the part of vitamin B deficiency in alcoholic diseases that alcohol itself is harmless—a mistake made by those opposed to drinking as well as those who like it. Although these diseases do unquestionably develop as a direct result of nutritional deficiency, he said, it is the consumption of too much alcohol and too little food that is responsible for the nutritional lack.

The alcohol acts in still another way to cut down the individual's ration of vitamin B,—by irritating the intestinal tract so that food is lost or avoided

MEDICINE AND THE SANITARIUM

Said Virgil—"Being myself no stranger to suffering, I have learned to relieve the sufferings of others"

In which we can see if we will, a point of tenderness, concern and sympathy for those in ill health Not that it is essential to fitness that a man must experience disease first himself before he may treat others effectively, but if he understands and grasps the feelings of the sufferer he is surely more suitable to care for others and to help them

Medicine, strangely, is a "business" in which the same efforts and facilities are used to "lose" patrons as well as to gain them. All its resources are devoted to achieving a goal where the patron no longer requires its services All its successes have their foundation on such efforts as tend to make its services dispensable

Except in the case of the invalid requiring care for the balance of life, the sanitarium is akin to Medicine in the

same respect To achieve and maintain success, it must be efficient in making its facilities useful to a patient for as short a space of time as may be necessary only to restore the ill to normal health and usefulness to society It is most successful in this generally because it is organized and equipped to give the individual attention so vital constantly, not only to assure complete recovery but to expedite it as well

Medical News

County News

Albany County

Dr J Rosslyn Earp, aged 49, medical editor of the State Health Department, died on May 19 in Albany Hospital. Dr Earp was author of many scientific publications, was former public health director of New Mexico, and had been a member of the New York State Health Department since 1937.

Chautauqua County

Two hundred persons attended a testimonial dinner held at Hotel Jamestown at Jamestown, May 16, in honor of Dr George W Cottis, who was chosen president-elect of the New York State Medical Society at the convention at Buffalo.

Dr D C Perkins, president of the Jamestown Medical Society, which sponsored the affair, presided and introduced Dr William D Johnson, of Batavia, past-president of the State Society and toastmaster at the dinner.

Present were members of the medical profession and their wives and western New York and Jamestown officials.

Dr W H Ross, of Brentwood, past-president and trustee of the State Society, said of Dr Cottis, as reported in the Jamestown Journal: "His mentality, his judgment, his honesty, his loyalty, and his other traits demonstrate his splendid character. No one has ever had any doubt of where he stands in relation to the problems of medicine."

In behalf of the laymen, S Miles Bouton said of Dr Cottis: "He is not only a great surgeon who, instead of keeping abreast of progress in his profession, keeps ahead of it. In the World War he demonstrated his patriotism and has been demonstrating it ever since. He is a scholar with the broadest intellectual interests, to whom all who come into contact with him listen with profit. He is a man of such high conception of civic duties that he gives too generously of his time and ability for the good of our city."

Greetings from his fellow sportsmen were extended by Murray T Davidson, who declared Dr Cottis was a great man of determination and the finest of associates on hunting and fishing trips.

A plaque, bearing the names of the members of the Jamestown Medical Society, was presented to Dr Cottis by Dr Frank P Goodwin.

The struggles of a boy who left school at the age of 10 to work for \$2.50 a week to help support the family and who eventually succeeded in obtaining a medical education was described by Dr Cottis in his response.

He continued: "All of us go through life over the road that is never straight or level for any long distance. We all go through the shadows in deep valleys and then rise to the summit where the sun is shining."

Dr Cottis in conclusion said: "It has been a joy to watch the development of the medical profession in this town, to see young men come along and give the service they do, to see the hospitals develop to what they are today, not only in size, but in equipment and efficiency, to see a great nursing profession develop, but above all to see the younger men come

along and develop as specialists. There were only two specialists here when I arrived and both were eye, ear, nose, and throat. Today, we have specialists in every branch, except neurology, and give as good service as can be found anywhere.

"The honor given me would be an empty one if it did not have the approval of my fellow colleagues in Chautauqua County. It seems to me tonight, to see all you folks here and to hear the words of my old and trusted friends, that the road has brought me to the summit of the mountain."

Delaware County

A plan to standardize fees charged by physicians for treating relief clients was submitted to the Board of Supervisors at Delhi on May 12 and was referred to the public welfare committee.

The plan, presented and explained by Dr Orrin Q Flint, secretary of the county society and physician for the county home, hospital, and jail, is "designed to provide for relief clients adequate medical care, which implies the same care and attention any nonindigent family receives and to keep the bill for medical relief as low as is consistent with this good medical care."

Although services rendered in each instance are the same, there has been a difference in fees for care of home relief, county hospital, old age relief, and others of the myriad classifications of relief cases.

The suggested schedule of fees sets forth that "physicians feel that certain of the present fees are impractical in that they are lower for services and materials than the actual cost of materials, such as cost of lenses and frames in eye work, and in other instances too high, such as hospital visits at \$1.00 each though a doctor might see several patients in the hospital in 20 or 30 minutes."

To effect an equitable schedule, the present state compensation schedule of rates was taken as a model and an average reduction of 50 per cent made "to conform to the consensus among physicians that 50 per cent of the total gross cash income is net income."

It was explained that the remaining 50 per cent covers the cost of goods sold, in the case of a doctor including his services or time, his training, experience, expenses, including both original cost of education and current running expenses.

An advisory committee, to be appointed by the county society and composed of three physicians, one pharmacist, and one dentist, was suggested. The committee would act on disagreements referred to it. Dr Flint said that the mere existence of such a body would keep doctors from making improper charges for services. They would not care to run the risk of censure by their fellow physicians, he added.

If a local welfare officer refused to authorize treatment for a relief client and the physician felt that such treatment was necessary, he could appeal to the county welfare officer and the advisory committee.

A PROBLEM IN TOURIST CAMPS

With some 35,000 tourist camps operating in the United States it is to be expected that new problems in health should arise

As many of these "overnight" arrangements for motorists are situated outside of city limits they are free of active city police and health department inspections. While it is true that a number of tourist camps are maintained by reputable people, these according to governmental reports are in a minority

Some years ago the American Automobile Association started listing Tourist Camps in their *Directory of Motor Courts and Cottages*. An effort to inspect such approved

camps was made, but inspections were undoubtedly made by persons untrained in hygiene and sanitation.

Economic conditions have created a large clientele for such establishments and in many states where there are numerous tourist attractions, the tourist camp has flourished without the strict health regulations that hotels in even villages are required to observe.

Today when travel within our country has increased for many reasons, these places will be patronized more than ever. Accordingly, now if ever, some effort should be made to effect safer and cleaner tourist camps for the protection of the public

[Continued from page 1306]

The schedule provides for a \$2 00 fee for the first office visit and \$1 00 for each subsequent visit. Home visits, within a 3-mile radius, would be \$2 00, up to 6 miles, \$3 00, up to 10 miles, \$4 00, and \$1 00 extra for each additional 4 miles. Hospital visits would be 50 cents. After the first home visit 50 cents would be charged for each additional patient. Nearby night visits, between hours of 10 00 P M and 7 00 A M, would be \$3 00. In most instances the maximum to be charged for any one case would be \$50.

The schedules list suggested fees for every possible kind of treatment or operation. Dr Flint described the plan as "the doctors' effort to remedy chiseling."

Dutchess County

Dr Clement Schotland of the Beth Israel and New York Post-Graduate hospitals, New York City, spoke on May 14 at a meeting of the county society at the Amrita Club in Poughkeepsie on "Pseudo-Hypertrophic Muscular Dystrophy." Motion pictures were shown.

Erie County

Ending a three-year controversy, the County Board of Supervisors on May 27 approved the so-called welfare medical plan which provides more adequate care for the indigent and permits Buffalo private physicians to charge for their services, says the Buffalo *Courier-Express*.

The board vote on the measure was 46 to 2. It is expected the plan will become effective July 1. The estimated annual cost is \$66,000, of which 40 per cent will be reimbursed by the state.

The plan calls for private physicians to be paid \$2 00 a home call, with the maximum charge set at \$50 a month. It also provides for the employment of four medical social workers at \$1,500 annually, five physicians at \$1,500 to augment the home call service, four pharmacists at \$1,200, and an appropriation of \$6,000 for drugs.

The plan will enable hundreds of private physicians to obtain recompense for their services which heretofore they have given free to welfare clients.

Fulton County

Dr Frederick A. D. Alexander, director of anesthesia at the Albany City Hospital, was the principal speaker at a meeting of the county society on May 22 at the Hotel Johnstown. Dr Alexander spoke on "Complications of Anesthesia."

Following Dr Alexander's address, a luncheon was served in the coffee shop of the hotel. There were twenty-five members present.

Jefferson County

The postponed monthly meeting of the county society was held on May 15 at the Black River Valley Club. Dinner was served at 6 30.

Orthopedic aspects of arthritis were discussed by Dr Louis Goldstein of the Strong Memorial Hospital in Rochester.

A sound movie on vitamin B complex was also shown.

The June meeting of the society will be held at Pine Camp, and the members will be guests of the Army Medical Corps.

Kings County

Dr Ralph I. Lloyd, of Brooklyn, president-elect of the American Academy of Ophthalmology and Oto-Laryngology, was honored at the nineteenth annual dinner of the Brooklyn Ophthalmological Society in the Montauk Club, on May 21.

A past-president of the society, Dr Lloyd, who has practiced for more than forty years, is consulting ophthalmologist at Cumberland Hospital and consulting oculist at Prospect Heights Hospital and Peck Memorial Hospital. He is a fellow of the American College of Surgeons.

Dr Lloyd was presented with a portable radio by Dr Joseph E. Golding, first president of the society, who was toastmaster. Speakers included Dr Maurice L. Wieselthier, president of the society, Dr Maurice J. Dattelbaum, president of the Kings County Medical Society, Dr Percy Fridenberg, founder of the Clinical Ophthalmology Society of New York, and Dr Algernon B. Reese, of Manhattan. Dr Walter V. Moore was chairman of the dinner committee.

Monroe County

The lives of 19 Rochester mothers were saved during the last year, the Maternal Welfare Committee of the county society reports.

The Rochester maternal death rate, it is reported, is one-half of what it was ten years ago and as low as any city of comparable size in the country. There were 19 less deaths in 1940 than in 1939.

Unless the birth rate rises, however, there will be in time an actual loss in population, the committee said, urging increases in those families which "can best provide their children with the advantages of life."

Doctors of Rochester and county towns have invitations from the County Welfare Department to participate in a "Rotating Panel System" of medical care for the indigent.

The system is designed to eliminate the direct-payment plan of welfare medical assistance and "to render adequate medical care at less cost."

Objections to the system are known to exist among physicians. In the letter explaining the system to the doctors, Jesse B. Hannan, county welfare director, and Dr Edward G. Whipple, medical director, who say a study of various programs throughout the country has been made, admit "none is wholly without objections on the part of both the physicians and the administrators of public welfare."

Nevertheless, Mr Hannan said that it is hoped to have the system in operation shortly. Many physicians already have offered to participate, he said.

The "Rotating Panel System" provides panels of four physicians in the city and of one to three physicians in each of nine rural districts, who would serve four months and then be replaced by new panels. City doctors would receive \$200 a month, town, \$50. Panels could be enlarged if necessary.

Under present arrangements some 350 physicians serve the county in the city alone. Unless the new system goes in effect, after June 1, on state orders, payment for medical care must be made to the welfare recipient, who in turn may, or may not, pass the money on to the physicians.

This so-called direct-payment plan is opposed. The county will continue to use the services of five full-time physicians under Civil Service appointment.

The regular meeting of the county society was held on Thursday evening, May 29, at the Academy of Medicine. Dr Samuel J Kopetzky, president of the State Society, spoke on "The Doctor's Place in the Defense Program." A business session preceded the meeting.

There were five candidates for membership: Dr Allen M Hill, Dr Richard B Phillips, Dr A J Tranella, Dr Exie Welsch, and Dr Philip Winslow.

New York County

The scientific program of the county society on May 26 included these addresses: (1) "Renal Extract in Hypertension," by Dr Benjamin Jablons, and (2) "Clinical and Experimental Hypertension," by Dr Frederick M Allen.

The Section of Obstetrics and Gynecology of the Academy of Medicine met on May 27, with the following program by the Woman's Hospital: (a) "Premature Separation of the Placenta," by Dr Ralph L Barret, (b) "Essential Mechanical Factors for Urinary Continence in Females," by Dr William T Kennedy, (c) "Roentgen Therapy for Acute Postpartum Mastitis," by Dr Harriet McIntosh, (d) "Erythroblastosis," by Dr Lyman Burnham, (e) "Results of Subcutaneous Implantation of Crystalline Estrogen and Progesterone," by Drs Daniel R Mishell and Leon R. Motyloff.

The following action has been taken by the county society to assure the sustained and effective treatment of patients of those physicians called to active military service. This provision makes the medical records of such patients available to other physicians under whose care they may come.

The call to active military duty of physicians now in practice has created a serious problem on the continuation of the treatment of patients now under their care. To meet this situation the county society has adopted the recommendation of its Committee on Medical Economics. This provision, of course, safeguards the confidential relationship between the patient and the physicians. The medical records will be made available to physicians only on instructions of the patient affected.

In pursuit of this action the county society has formulated the following standard communication which physicians might send to their patients:

"I have been called to active duty in the military forces of the U S. I have enjoyed

the privilege of attending you in the past and regret the necessity of terminating our association at this time. However, I shall resume the practice of medicine as soon as my term of active duty is completed. In the interim, if you will notify my office of the name and address of the physician whom you consult, a résumé of my record and suggestions for your treatment will be forwarded to this physician."

Queens County

The county society met on May 27, and listened to a paper on "The Treatment of the Premature Infant," by Dr Hugh Chaplin, pediatrician, Bellevue Hospital. Discussion was led by Dr Leona Baumgartner, acting director of Bureau of Child Hygiene, Department of Health, and Dr W C A Steffen, director of pediatrics, Flushing Hospital.

Rensselaer County

Colonel Louis H Bauer, M D, Fellow of the American College of Physicians and consultant in aviation medicine for the Civil Aeronautics Administration, spoke on "Aviation Medicine" at the meeting of the county society at The Hendrick Hudson on May 13.

Schoharie County

The county society held its May meeting at the Central School in Middleburgh. At the business session the following officers were nominated, the election to be held at the annual meeting in the fall: president, R G S Dougall, of Cobleskill, vice-president, L R. Becker, of Cobleskill, treasurer, Duncan Best, of Middleburgh, secretary, Donald Lyons, of Middleburgh, censor, Joseph Duell, of Jefferson, and delegate to the State Society, David W Beard, of Cobleskill.

At the afternoon session papers were given by Dr James Greenough and Dr Leroy S House, of Oneonta, on tumor clinics and by Dr William P Brown of the Health Service Bureau of the State Education Department on "The School Physician." Dr David W Beard, president for the past two years, presided.

Sullivan County

Dr Ralph S Breakey, of Monticello, was scheduled for the presidency of the county society, and Dr Cornelius Duggan, of White Lake, was honored for 50 years in the practice of medicine, at the semi-annual meeting, attended by forty physicians, on May 21 at the Lenape.

At least three other physicians in the county have also begun the second half of a century of practice. They are Dr John A Miller, of Roscoe, 53 years, Dr Russell W Allan (dentist), of Monticello, 51 years, and Dr Rosetta S Hall, of Liberty, 52 years.
